Lucia Turri

Dear Colleagues,

on behalf of the ISIORT, we welcome you to the 9th International ISIORT Conference held in Novara, Italy, June 24-25, 2016. It is hoped that the rich and intense scientific programme will make this meeting a fruitful event with emphasis not only on the current clinical standard but also on the new opportunities and future views of our discipline.

Marco Krengli
President, ISIORT

Under the auspicies of

ESTRO European Society for RADIOTHERAPY & ONCOLOGY

esso The European Society of Surgical Oncology — Endorsed

ALATRO Asociación Ibero Latinoamericana de Terapia Radiante Oncológica

RAO Associazione Italiana di Radioterapia Oncologica

RAB Società Italiana di Radiobiologia

aifm Associazione Italiana di Fisica Medica

UPO Università del Piemonte Orientale

Azienda Ospedaliero-Universitaria Maggiore della Carità di Novara

PROGRAM

Friday, June 24

08:15 REGISTRATION

08:50 – 13:00 **_Educational course: IORT in Partial Breast Irradiation_**

8:50 *Introduction:* **Marco Krengli**

Clinical basis

Chair: **Felix Sedlmayer, Alberto Luini**

Update of results of randomized trials:

9:00 TARGIT
Elena Sperk

9:20 ELIOT
Roberto Orecchia

9:40 Discussion

9:50 UPDATE OF ASTRO/GEC-ESTRO RECOMMENDATIONS FOR PATIENT SELECTION
Maria Cristina Leonardi

10:10 Discussion

10:20 Coffee break

Practical aspects of the IORT procedure

Chair: **Claudia Schumacher, Michele Avanzo, Antonella Ciabattoni**

IORT by electrons

10:40 SURGICAL ASPECTS
Alberto Luini

10:55 PHYSICAL ASPECTS
Stefania Comi

11:10 Discussion

IORT by Kv x-rays

11:20 SURGICAL ASPECTS
Marc Sütterlin

11:35 PHYSICAL ASPECTS
Frank Schneider

11:50 Discussion

New perspectives in translational research

Chair: **Hugo Marsiglia, Robert Krempien**

12:10 BIOMOLECULAR AND HISTOLOGICAL PROGNOSTIC FACTORS FOR IN BREAST RECURRENCES AFTER IORT AS A BOOST IN BREAST CANCER
Gerd Fastner

12:30 GENOMIC SELECTION OF PATIENTS IN PBI
Pedro Lara

12:50 Discussion

13:00 Lunch

14:00 **Welcome address**

14:20 – 15:40 *Evidence Based Medicine and IORT*

Chair: **Felipe Calvo, Umberto Ricardi**

14:20 BREAST CANCER
Antonella Ciabattoni

14:40 GASTRO-INTESTINAL TUMORS
Michael Haddock

15:10 SARCOMA
Falk Roeder

15:30 Discussion

15:40 – 17:00 *Selected oral presentations: breast I*

Chair: **Antonella Ciabattoni, Mikheil Janjalia**

15:40 FULL-DOSE 21 Gy INTRAOPERATIVE ELECTRON RADIOTHERAPY IN EARLY BREAST CANCER: RESULTS AFTER A MEDIAN 5.2 -YEARS FOLLOW UP IN 758 PATIENTS FROM A SINGLE ITALIAN INSTITUTION
Takanen S., Gambirasio A., Gritti G., Källi M., Andreoli S., Fortunato M., Feltre L., Filippone F.r., Iannacone E., Maffioletti L., Muni R., Piccoli F., Mauri E.m.p., Giovannelli M., Burgoa L., Paludetti A., Ferro M., Palamara F., Fenaroli P., Cazzaniga L.f. (Bergamo, Italy)

15:50 BREAST CONSERVING SURGERY: INTRAOPERATIVE RADIOTHERAPY USING NOVAC 7, EXPERIENCE WITH 703 CASES AT CITTÀ DI CASTELLO HOSPITAL
Alessandro M., Ferranti F., Massetti M., Corazzi F., Angelini M., Pentiricci A., Rossi G. (Città di Castello, Perugia, Italy)

16:00 PARTIAL BREAST WITH ELECTRONS: PRELIMINARY RESULTS OF THE MULTICENTER GROUP OF THE EMILIA ROMAGNA REGION ITALY
Stefanelli A., Zini G., Baldissera A., Frezza G., Iotti C., Venturini A., Perini F. (Ferrara, Italy)

16:10 LOCAL RECURRENCE IN BREAST CANCER PATIENTS TREATED WITH IORT vs CONVENTIONAL EBRT IN EARLY STAGE BREST CANCER: OUR SINGLE CENTRE RETROSPECTIVE CASE-CONTROL STUDY, TREVISO HOSPITAL
Lekaj M., Cesaro G., Gava A. (Padova, Italy)

16:20 INTRAOPERATIVE RADIOTHERAPY FOR EARLY BREAST CANCER: A MONOCENTRIC EXPERIENCE
Baldissera A., Giaccherini L., Marinelli I., Mosconi F., Manganelli F., Guidi E., Romagnoli R., Magi S., Ricci R., Palombarini M., Parisi A., Cucchi M.C., Ferrarini R., Frezza G. (Bologna, Italy)

16:30 ANALYSIS OF DATA FROM THREE CENTERS IN TURKEY ON INTRAOPERATIVE RADIOTHERAPY OF BREAST CANCER
Bese N., Altinok A., Alan O., Dizdar N., Caglar H., Ince U., Uras C. (Istanbul, Turkey)

16:40 WHICH FACTORS CONTRIBUTE TO EARLY TUMOR CONTROL FAILURE AFTER APBI/IOERT FOR ELDERLY BREAST CANCER PATIENTS?
Koper P., Fisscher U., Mast M., Petoukhova Anna L., Marinelli A., Van Der Sijp J., Franssen J., Merkus J., Jannink I., Gescher F., Speijer G., Roeloffzen E., Zwanenburg A., Francken A.b., Struikmans H. (The Hague, The Netherlands)

16:50 TARGIT E(LDERLY) - PROSPECTIVE PHASE II STUDY OF INTRAOPERATIVE RADIOTHERAPY (IORT) IN ELDERLY PATIENTS WITH SMALL BREAST CANCER
Sperk E. (Mannheim, Germany)

17:00 Coffee break

17:20
18:10

Selected oral presentations: breast II

Chair: **Elvio Russi, Claudia Schumacher**

17:20 IOERT AS ANTICIPATED TUMORBED BOOST IN BREAST CANCER OF CLINICAL STAGES I-III:UPDATED 10-YEARS RESULTS
Fastner G., Kaiser J., Kronberger C., Moder A., Kopp P., Wallner M., Reitsamer R., Fischer Th., Fussl C., Zehentmayr F., Sedlmayer F. (Salzburg, Austria)

17:30 INTRAOPERATIVE ULTRASOUND ROLE IN BREAST INTRAOPERATIVE ELECTRON RADIATION THERAPY (B-IOERT) BOOST
Vidali C., Severgnini M., Bortul M., Bellio G., Urbani M., Toscano L., De Denaro M., Beorchia A. (Trieste, Italy)

17:40 INTRAOPERATIVE ELECTRON BOOST RADIOTHERAPY (IOERT) FOR EARLY STAGE BREAST CANCER: INSTITUTIONAL EXPERIENCE (2009-2015)
Calín A., Muñoz M., Blanco J., Guerrero L., Sierra I., Santos M., Arnaiz J., Davo A., Lozano M., Alvarado E., Lizarraga S., **Calvo F.** (Madrid, Spain)

17:50 INTRAOPERATIVE RADIATION THERAPY FOR BREAST CANCER:
A PHYSICAL AND CLINICAL REVIEW OF IRANIAN EXPERIENCE
Mahdavi S.R.M., **Akbari M.E.**, Nafisi N., Mirzaei H.R. (Tehran, Iran)

18:00 RISK FACTORS FOR IPSILATERAL BREAST CANCER RECURRENCE AFTER INTRAOPERATIVE RADIOTHERAPY (IORT)
Sperk E., Teich P., Weiss C., Sütterlin M., Wenz F. (Mannheim, Germany)

18:10
18:30 **Lecture: Imaging in IORT: any progress?**

Introduction: **Felipe Calvo**
Speaker: **Javier Pascau**

18:30
18:50 **Lecture: Potential Clinical Trials with IORT and Immunotherapy**

Introduction: **Michael Haddock**
Speaker: **John Grecula**

20:00 Social Dinner

Saturday, June 25

08:00 – 09:20 *Selected oral presentations: various tumor sites*

Chair: **Carlos Ferrer, Sergio Gentilli**

08:00 RADIOLOGICAL PELVIC CHANGES AFTER INTENSE ADJUVANT LOCAL THERAPY INCLUDING INTRAOPERATIVE PRESACRAL ELECTRON BOOST IN LOCALLY ADVANCED RECTAL CANCER: PREDICTIVE ANALYSIS
Muñoz M., Serrano J., Alvarado E., Guerrero L., Santos M., Lozano M., **Calvo F.** (Madrid, Spain)

08:10 INTRA-OPERATIVE RADIOTHERAPY WITH ELECTRONS (IOERT) AND SURGERY IN PRIMARY RECTAL TUMORS:RESULTS OF OUR INSTITUTION
Morillo Macías V., Bouché A., Ferrer C., López J., Boldó E., Lozoya R., Mayol A. (Castellón, Spain)

08:20 INTRA-OPERATIVE RADIOTHERAPY WITH ELECTRONS (IOERT) AND SURGERY IN PELVIC RECURRENCE: RESULTS OF OUR INSTITUTION
Morillo Macías V., López J., Bouché A., Ferrer C., Boldó E., Lozoya R., Mayol A. (Castellón, Spain)

08:30 PANCREATIC CANCER: RESULTS AFTER RESECTION AND OPTIMIZED ESCALATED IRRADIATION
Muñoz M., Alvarado E., Sierra I., Guerrero L., Santos M., Arnaiz J., Garcia Sabrido G., Ascensio J., Gómez M., **Calvo F.** (Madrid, Spain)

08:40 EXTREMITY PRESERVATION IN PRIMARY SOFT TISSUE SARCOMAS AFTER RADICAL INTENT SURGERY AND DOSE-DENSE RADIOTHERAPY"
Calvo F. (Madrid, Spain)

08:50 INCLUDING INTRAOPERATIVE RADIOTHERAPY IN THE THERAPEUTIC SCHEME RESULTS IN SIMILAR LOCAL CONTROL IN HIGH AND LOW RISK SARCOMA
Boldo E., Piquer T., Mayol A., Lozoya R., Bouche A., Morillo V., Lopez Tarjuelo J., Ferrer C. (Castellón, Spain)

09:00 INTRAOPERATIVE RADIOTHERAPY AND VASCULAR RESECTION
Boldo E., Piquer T., Lozoya R., Mayol A., Molina J., Admeller X., Bouche A., Morillo V., Ferrer C. (Castellón, Spain)

09:10 USER EVALUATION OF AN IOERT DEDICATED ONLINE INTERACTIVE SCIENTIFIC PLATFORM
Alvarado E., Silos m., Sierra I., Guerrero L., Pascau J., **Calvo F.** (Madrid, Spain)

09:20 – 10:30 *Physics Session*

Chair: **Wilhelmus Dries, Frank Hensley**

09:20 SAFETY IN IORT PROCESS AND QA ISSUES
Karla Torszok

09:40 IN VIVO DOSIMETRY IN IORT TREATMENTS
J. Lopez-Tarjuelo

10:00 CHALLENGES IN IORT DOSIMETRY: THE MISSION OF THE AIFM WORKING GROUP, ITS EXPERIENCE AND WORKING HYPOTHESES
Loris Menegotti

10:20 Discussion

10:30
12:00

Radiobiology Session

Chair: **Renzo Corvò, Elena Sperk**

10:30 RADIOBIOLOGY OF LOW-ENERGY X-RAYS AND HIGH SINGLE DOSES
Elena Sperk

10:50 MICROENVIRONMENT BY X-RAYS IORT
Gustavo Baldassarre

11:10 INTRAOPERATIVE RADIOTHERAPY IMPAIRS BREAST CANCER STEM CELL PHENOTYPE INCREASED BY SURGICAL WOUNDING
David Murawa

11:30 Discussion

running coffe break 10:30/11:30

11:40
12:30

Satellite Symposium (see pag. 10)

12:30 Lunch

13:15
13:45

General Assembly

13:45
14:30

Lecture: Long term survivors after IORT: a lesson to be learned

Introduction: **Roberto Orecchia**
Felipe Calvo, Michael Haddock, Felix Sedlmayer

14:30
15:40

Selected oral presentations: biology and physics

Chair: **Giovanni Ivaldi, Gianfranco Loi**

14:30 RADIOBIOLOGICAL ASPECTS OF INTRA OPERATIVE RADIOTHERAPY
Akbari M.E., Nafisi N., Mirzaei H.R., Mahdavi S.R.M. (Tehran, Iran)

14:40 APOPTOTIC PATHWAY ACTIVATION IN PROSTATE NEOPLASTIC CELLS AFTER 12 GY-IORT
Pisani C., Domagala N., Copes F., Mercalli F., Volpe A., Beldì D., Boccafoschi F., Boldorini R., Krengli M. (Novara, Italy)

14:50 IN VIVO DOSIMETRY BY EBT3 GAFCHROMIC FILMS DURING IORT BREAST TREATMENT
Manco L., Stefanelli A., Zini G., De Troia A., Carcoforo P., Hernandez Flores F., De Guglielmo E., Fabbri S., Turra A. (Ferrara, Itay)

15:00 VARIABLES AFFECTING DISC ATTENUATOR ALIGNMENT IN BREAST INTRAOPERATIVE RADIOTHERAPY (IORT)
Ivaldi G.B., Tabarelli De Fatis P., Liotta M., Malovini A. (Pavia, Italy)

15:10 BREAST IOERT AND SHIELDING DISCS – MORE THAN A SIDEKICK?
Hamedinger D., Track C., Moser K., Bräutigam E., Wiesauer K., Putz E., Geinitz H. (Linz, Austria)

15:20 COMPARING THE DOSIMETRIC CHARACTERISTICS OF THE ELECTRON BEAM FROM DEDICATED INTRAOPERATIVE AND CONVENTIONAL RADIOTHERAPY ACCELERATORS
Mirzaei H.R., Baghani H.R., Aghamiri S.M.R., Mahdavi S.R.M., Akbari M.E., Nafisi N. (Tehran, Iran)

15:30 COMPARISON OF MOBETRON 1000 AND MOBETRON 2000 FOR IOERT
Petoukhova Anna L., Wingerden K.V., Egmond J.V., Koper P., Ceha H., Stam T., Peeters M., El Kadaoui M., Tan J., Struikmans H. (The Hague, The Netherlands)

15:40 / 16:50 *Ongoing Trials and Prospective Studies*

Chair: **Antonino De Paoli, Ignacio Azinovic**

15:40 HIOB PROTOCOL
Gerd Fastner

15:50 MULTI-INSTITUTION PHASE II TRIAL OF INTRAOPERATIVE ELECTRON BEAM RADIOTHERAPY BOOST AT THE TIME OF BREAST CONSERVING SURGERY WITH ONCOPLASTIC RECONSTRUCTION IN WOMEN WITH EARLY-STAGE BREAST CANCER
Jose Bazan

16:00 MULTIDISCIPLINARY MANAGEMENT IN SPINE METASTASIS (V-IORT)
Roberto Orecchia

16:10 IORT IN RECONSTRUCTION SURGERY
Luis Marin

16:20 RETROPERITONEAL SARCOMA
Falk Roeder

16:30 IORT IN HIGH-RISK PROSTATE CANCER
Michele Billia

16:40 CURRENT STATUS OF THE ISIORT REGISTRY
Marco Krengli

16:50 / 17:00 **Closing remarks**

FACULTY

GENERAL INFORMATION

MEETING VENUE

Auditorium Banca Popolare di Novara
Via Carlo Negroni, 11 - 28100 Novara (Italy)

The Auditorium is located in the heart of the historic centre of Novara, just a few steps from Basilica of San Gaudenzio.

REGISTRATION FEES *in Euro VAT included*

Conference

REGULAR	*€ 150,00*
RESIDENTS*	*free*
FACULTY	*free*

* only attached the attendance certificate

SOCIAL DINNER

Social Dinner, included in the regular Conference fee, will be held on Friday, June 24 - 20:00 hrs at **Club Unione** Via Giacomo Puccini 2, Novara

REGULAR FEE COVERS

Admittance to the scientific session of the congress, congress material, access to technical exhibition, refreshments during breaks and lunches as indicated in the final program, social dinner.

RESIDENTS REGISTRATION COVERS

Admittance to the scientific session of the congress, congress material, access to technical exhibition, refreshments during breaks and lunches as indicated in the final program.

BEST ORAL PRESENTATION AWARD

The best oral presentation selected by the ISIORT Board will be awarded.
The award amount of € 600,00 is supported by ISIORT.

LANGUAGE

The official language of the Meeting is English.

ATTENDANCE CERTIFICATE

At the end of the Meeting, an attendance certificate will be issued to all registrered Participants.

VARIATIONS

The Scientific and the Organizing Secretariat reserve the right to make whatever change to the program they deem necessary for scientific and/or technical reasons.

PRIVACY

Information according to Legislative Decree 30/06/2003 No. 196 ("Law regarding the protection of personal data"): your personal data provided on this occasion will be processed manually and electronically in order to document your participation in Congresses, Events, Meetings and other Events organized by Ad Arte Srl and treatments arising from legal obligations. They will be communicated to suppliers and third parties involved or participating in the Event, as well as to the competent authorities, in compliance with the law and will be used for sending the periodic Newsletter containing update on the events of your interest organized by Ad Arte . Providing data for such purposes, it is compulsory for your participation in the Congress, the refusal will prevent participation. The data controller is Ad Arte Srl - Via M. D'Azeglio 51 2-40123 Bologna, Italy. You shall have all the rights under Title II of the Legislative Decree 30/06/2003 No. 196. The signature on the forms prepared for Congress (registration form, sponsor and speakers forms, etc.) constitutes acknowledgment of this Notice and the rights set out above, and enables the processing of personal data and the communication for the above purposes.

Surgical aspects of Intraoperative Radiotherapy with Electrons

Alberto Luini- Fabio Bassi
European Institute of Oncology
MILAN

Multidisciplinarity is an integral part of the treatment of breast cancer.
Breast conserving surgery and personalized medical therapy are now accompanied by extremely focused and precise radiotherapy.
With this approach, ELIOT is a new way of improving the adjuvant treatment

Six steps for the ELIOT procedure

1. Tumor removal
2. Thoracic wall protection
3. Temporary breast gland reconstruction
4. Collimator placement
5. Radiotherapy
6. Breast reconstruction

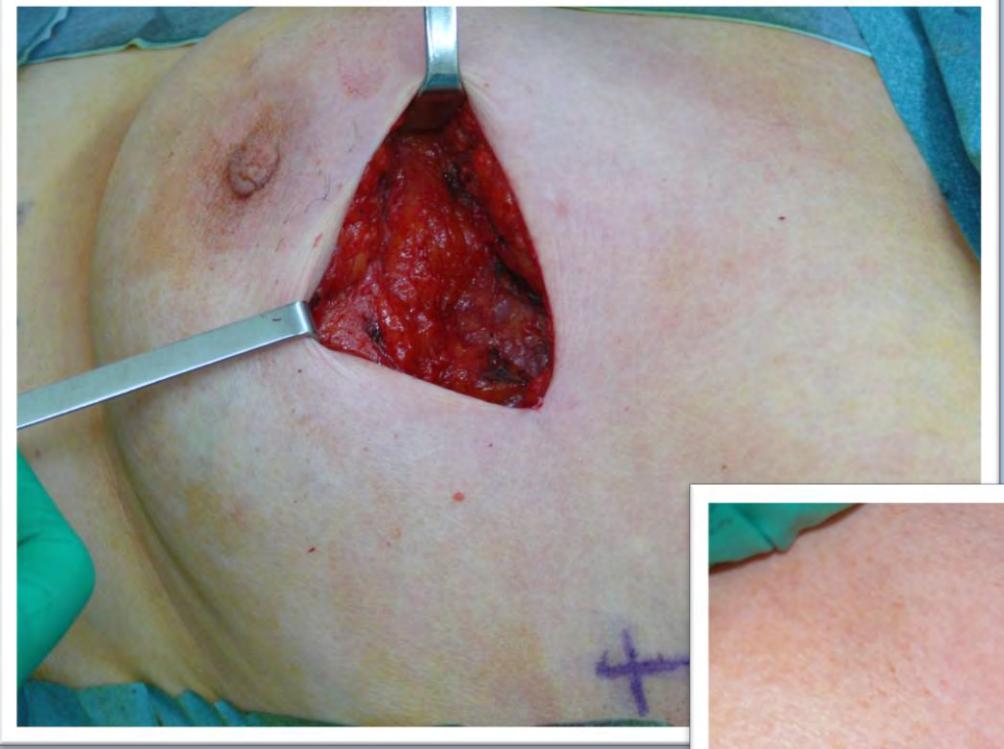
The first step:
tumor removal by quadrantectomy or partial resection.

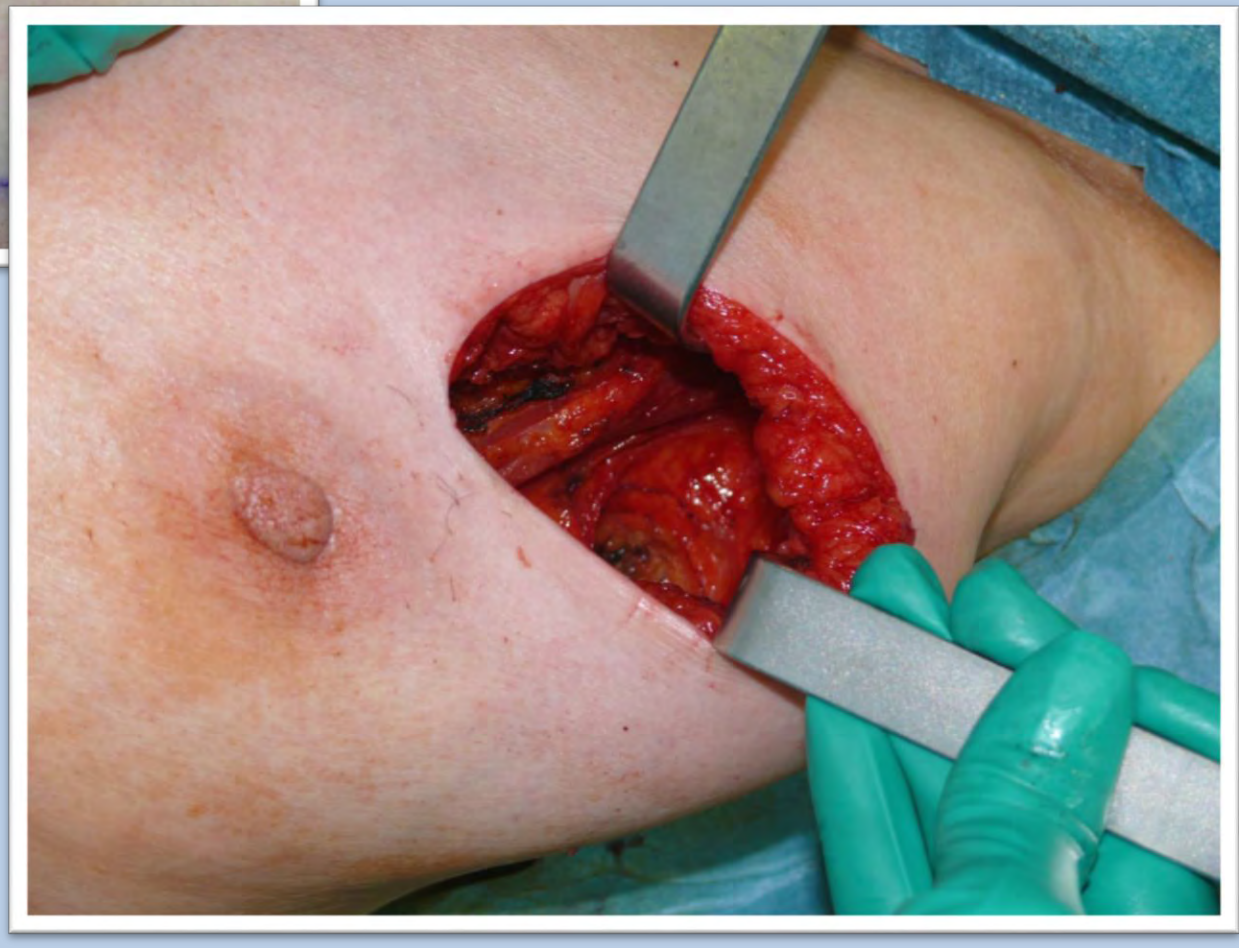
quadrantectomy

Cancer removal

The wide breast resection is done in the same manner as in standard BCS: radial skin incision centered on the tumor or periareolar incision for tumors relatively close to the areola.

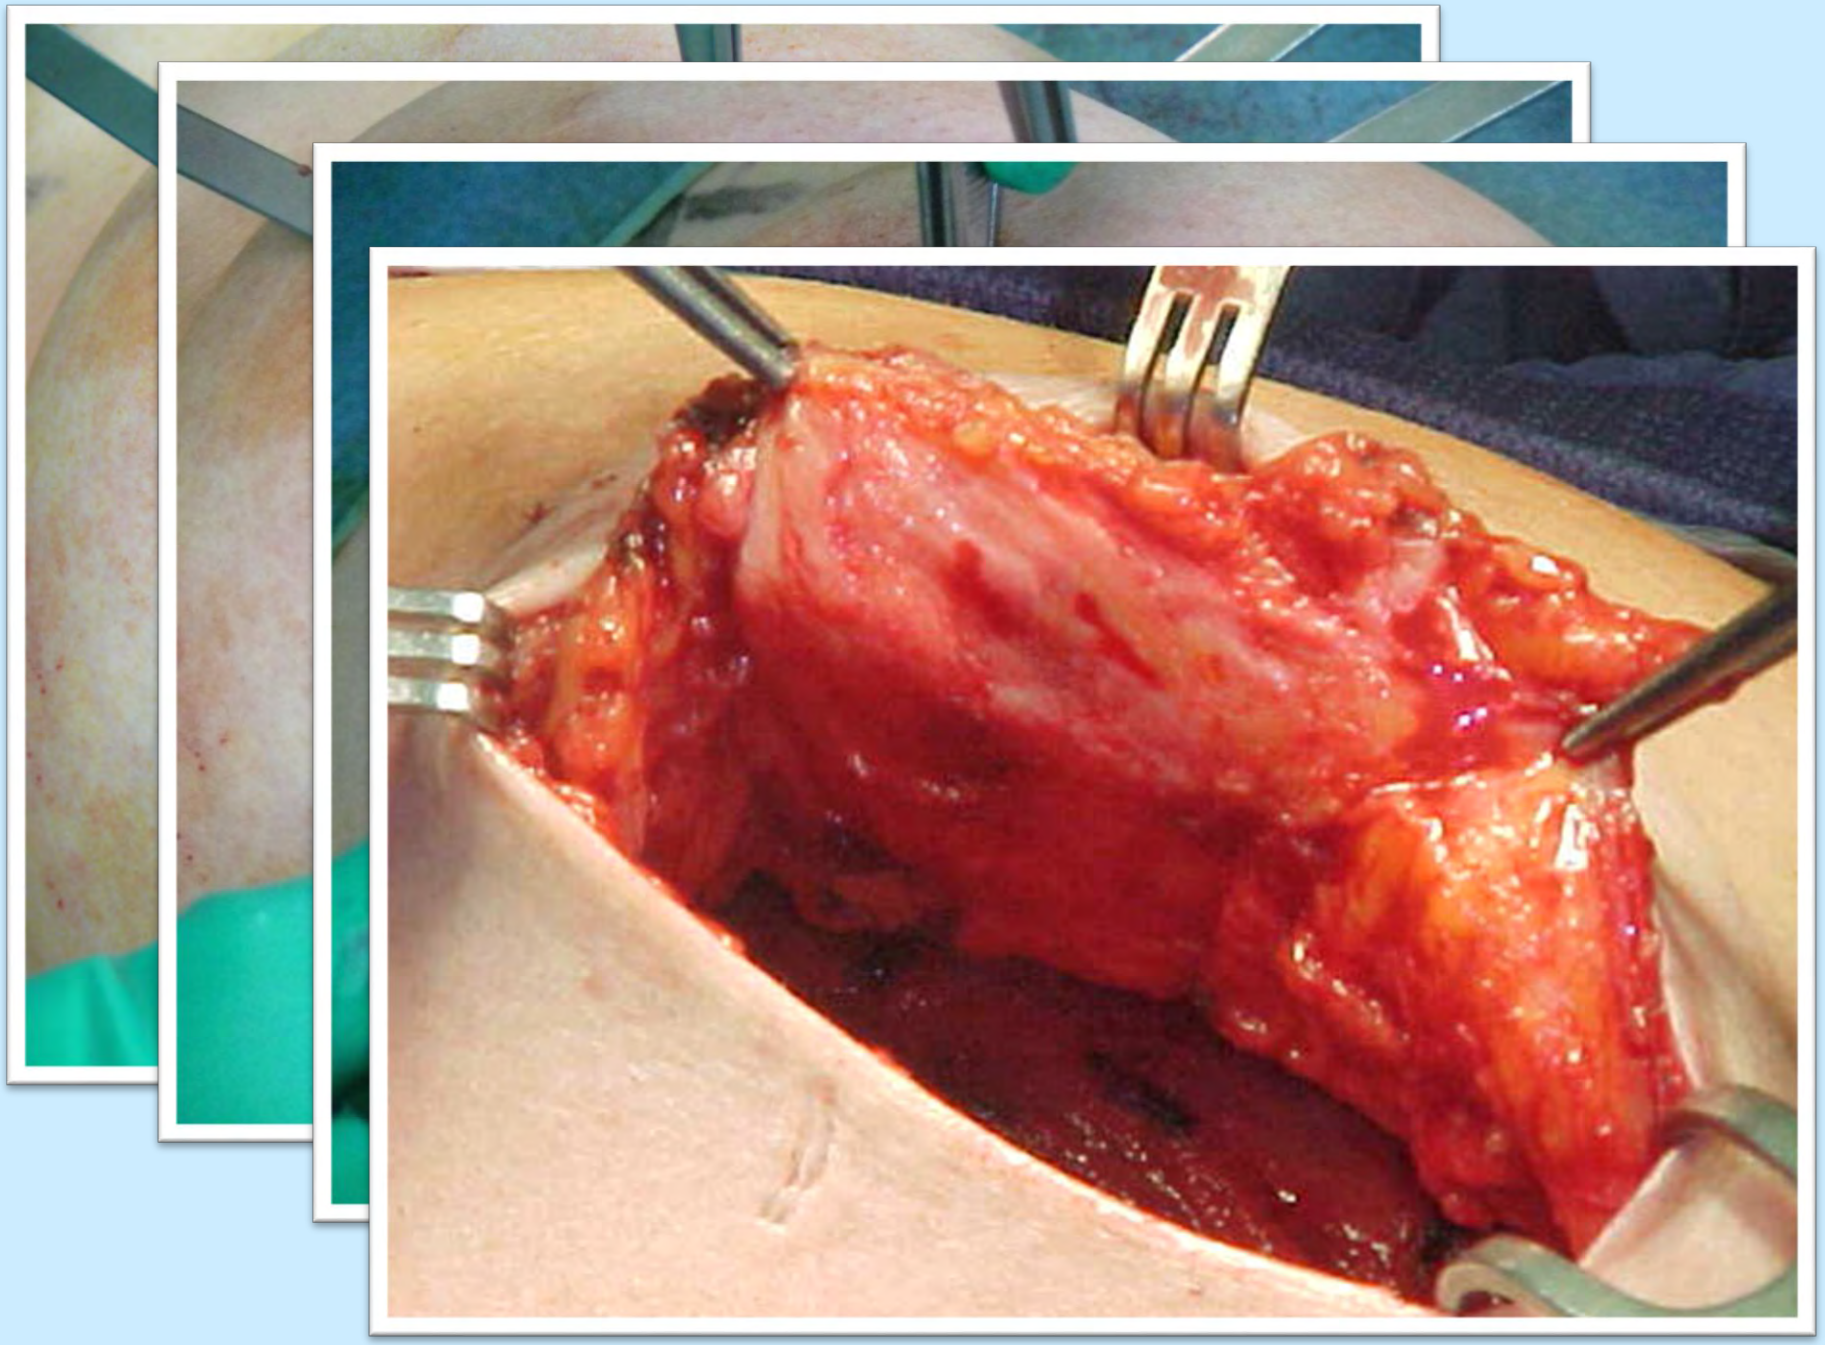
The ELIOT procedure does not interfere with the oncological criteria of "classic" BCS (1 cm grossly free margins of resection, usually including a small ellipse of skin). The excision deeply extends to the fascia of the pectoralis major muscle, which is usually spared.

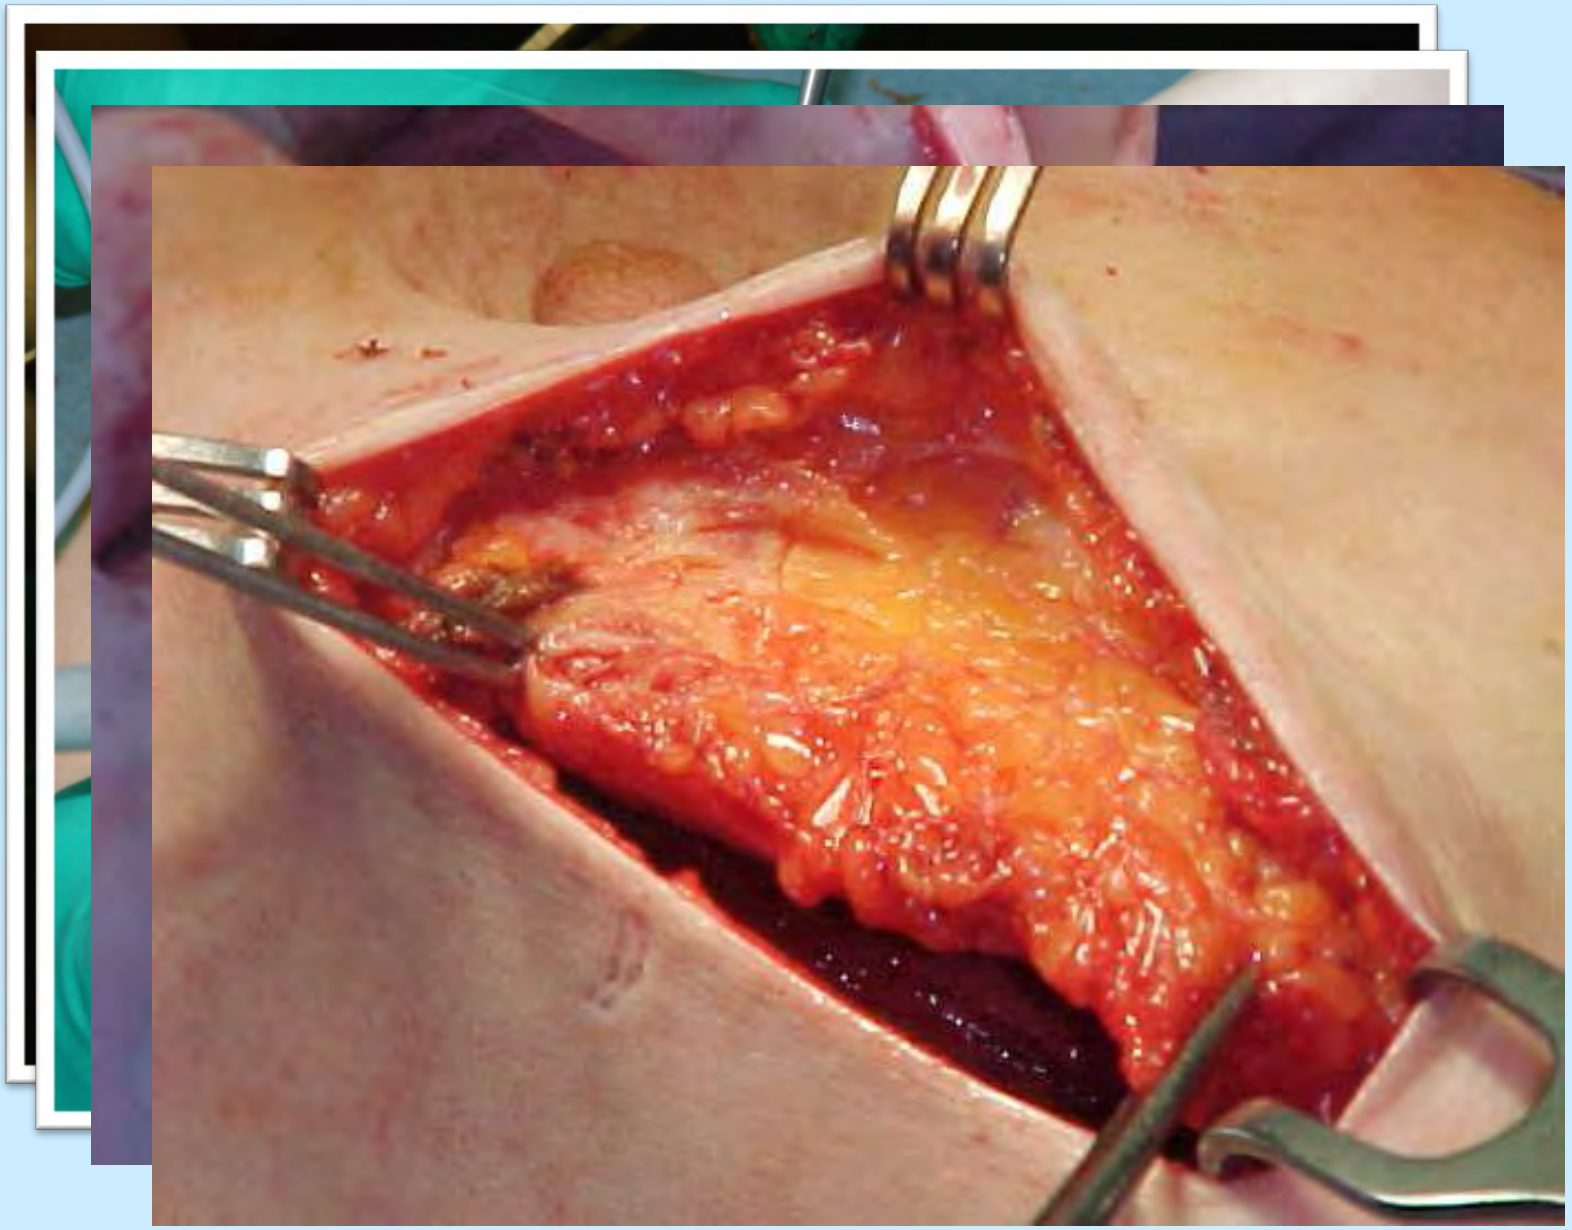




Breast mobilization

The wide mobilization of the mammary gland from the surrounding fascia of the pectoralis major and, superficially, from the skin, represents a critical step, permitting the optimal exposure of the "target" to the radiation beam.





The second step: after the isolation of an adequate area all around the surgical breach, protection of the thoracic wall using lead and aluminium disks.

Thoracic wall protection

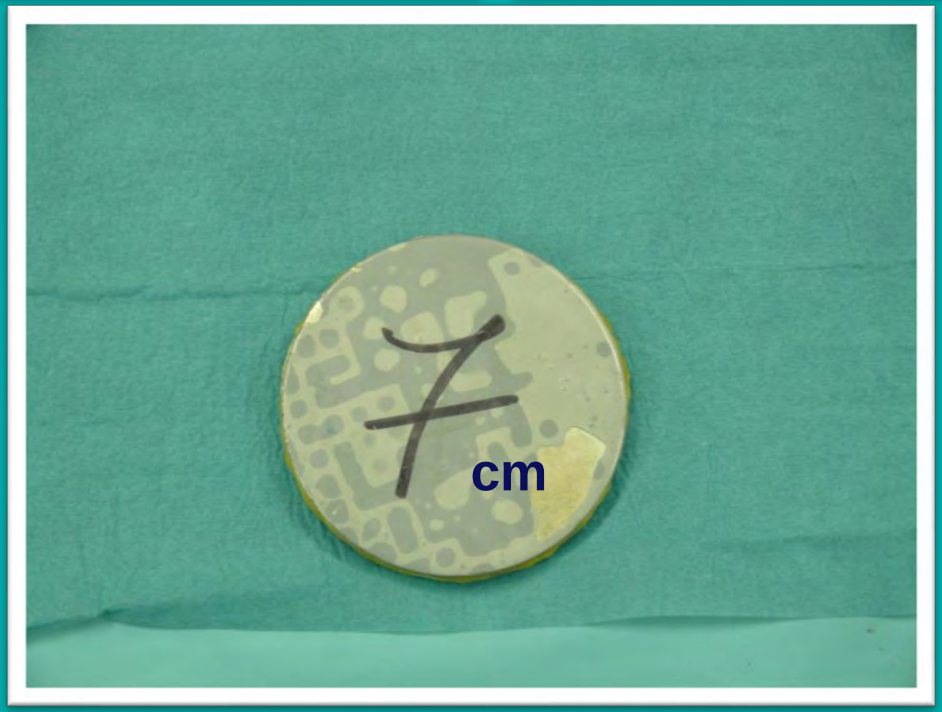
To minimize the irradiation delivered to the thoracic wall and to guarantee the delivery of the full radiation dose, a dedicated lead disk 5 mm thick and an aluminum disk 4 mm thick, available in various diameters (4,5,6, 8 and 10 cm), are commonly used as protective devices.

Thoracic wall protection

The disks are inserted together in the space between the gland and the pectoral muscle. Wall protection is guaranteed by the absorption properties of the lead disk combined with the aluminum disk for the absorption of the electrons back-scattered by the lead disk itself. Moreover, the 9-mm distance created by the two disks represents an additional guarantee of thoracic protection.

Alluminium face

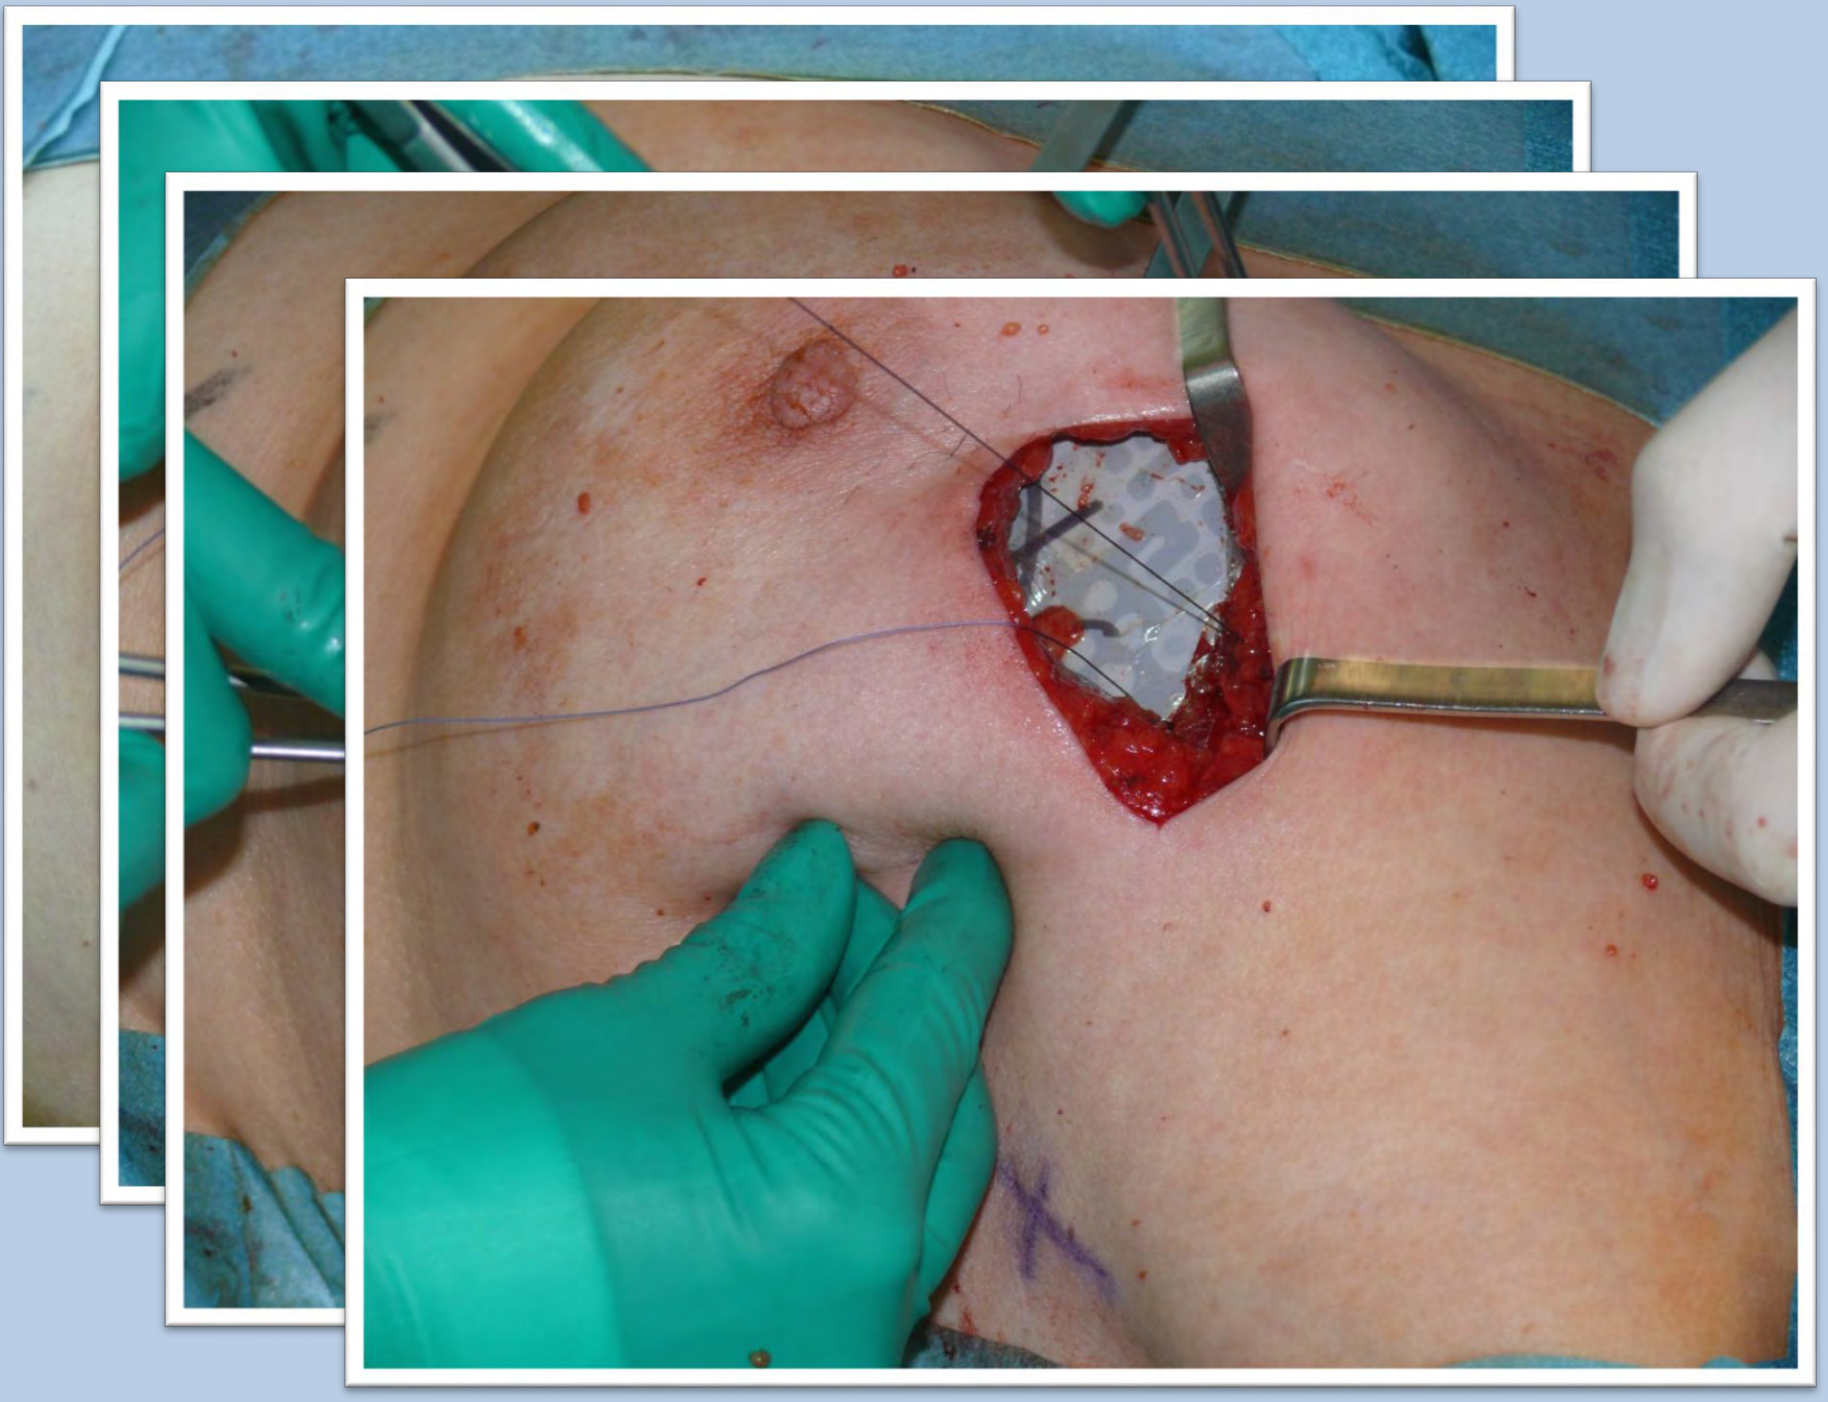
Lead face
8 cm

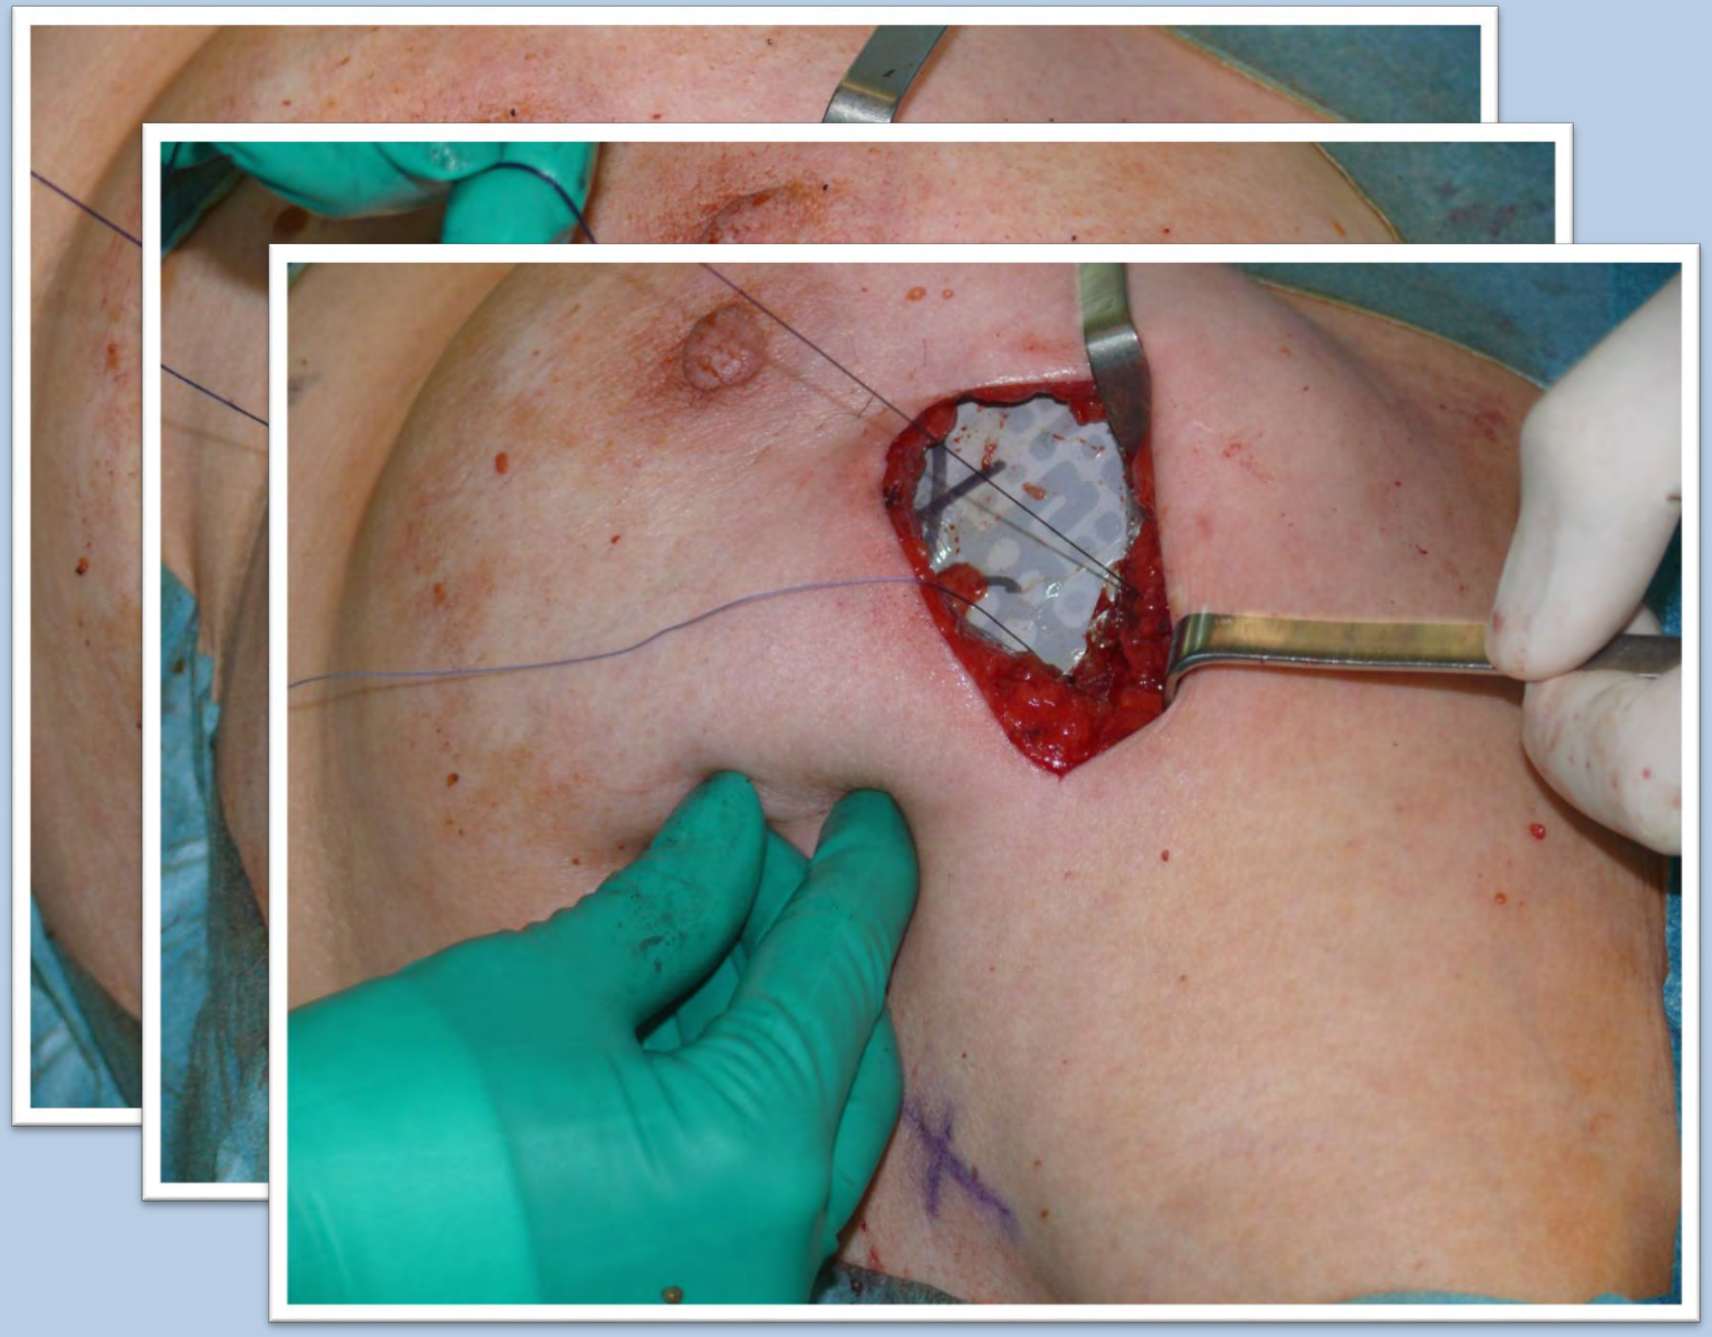


7 cm

Thoracic wall protection

To allow the best protection of the thoracic wall, the disks must be at least equal or greater in size to the breast target size. According also to the width of the skin incision, the largest disks must be chosen and placed exactly under the mammary target to be irradiated.





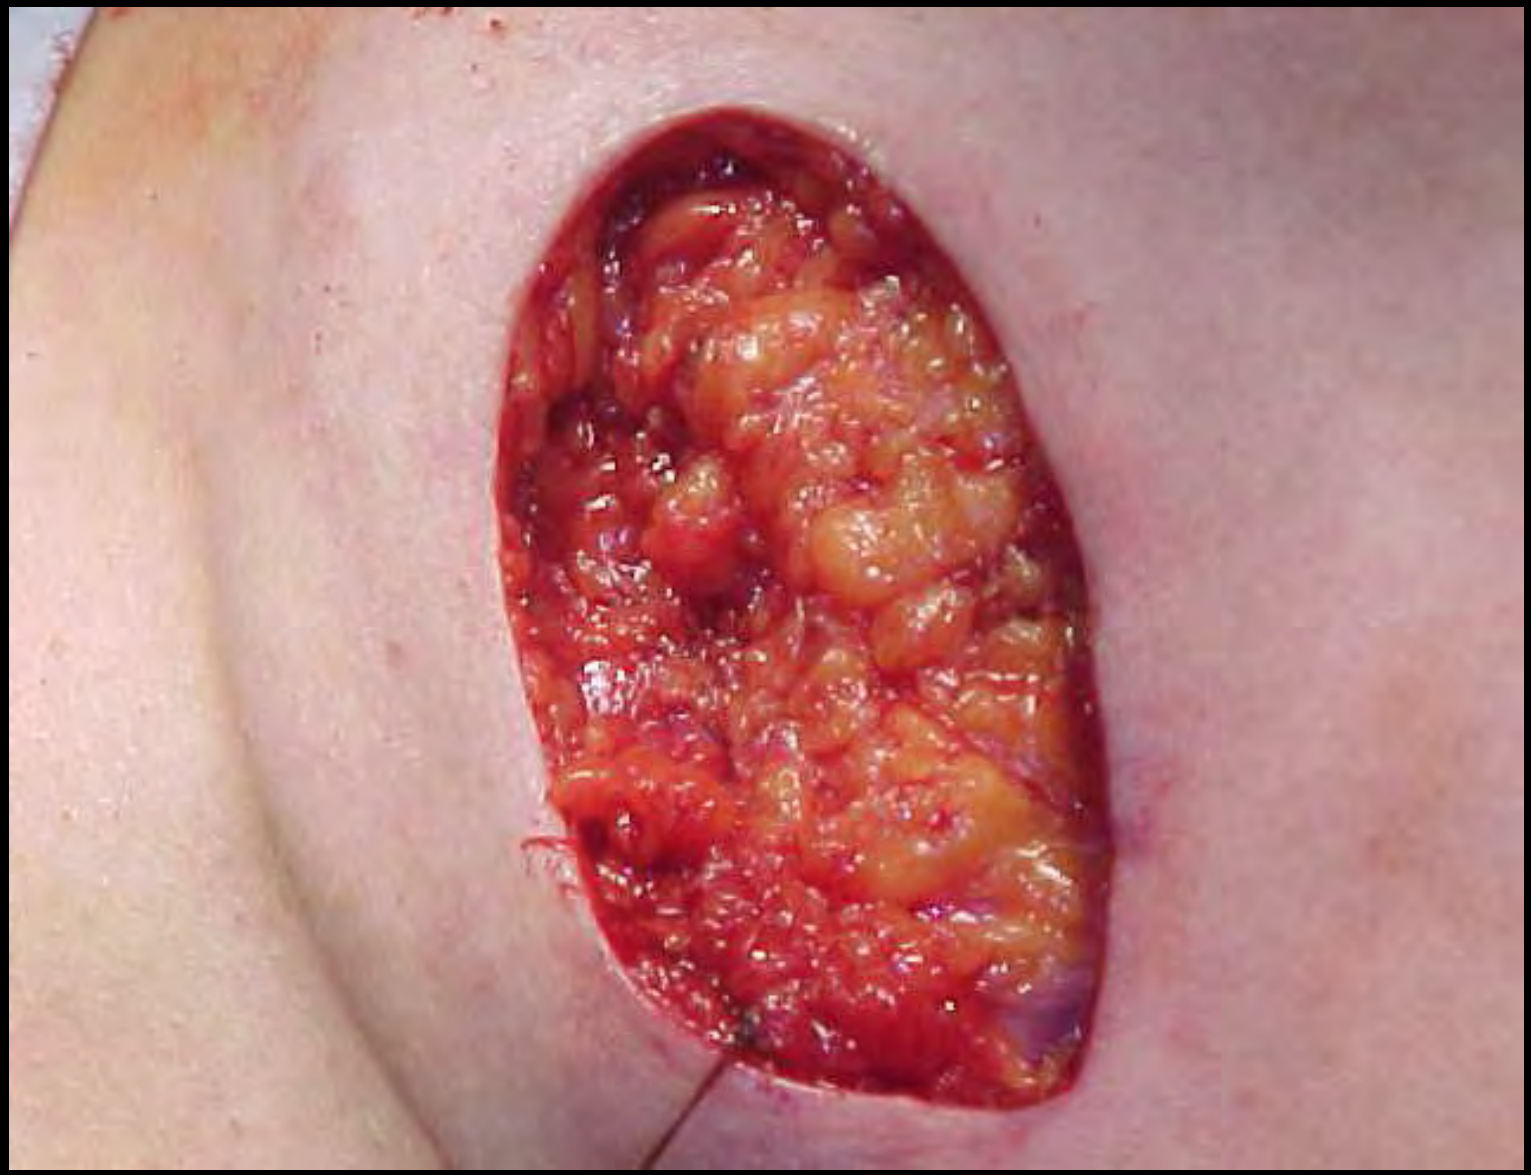
Breast gland reconstruction

The gland must be reconstructed over the disks avoiding excessive non-homogeneity in the shape of the target volume. In fact, the electron beam energy is chosen on the basis of the thickness of the target volume, and the best dose distribution of radiotherapy in the gland is achieved if the thickness of the irradiated target remains as homogeneous as possible.

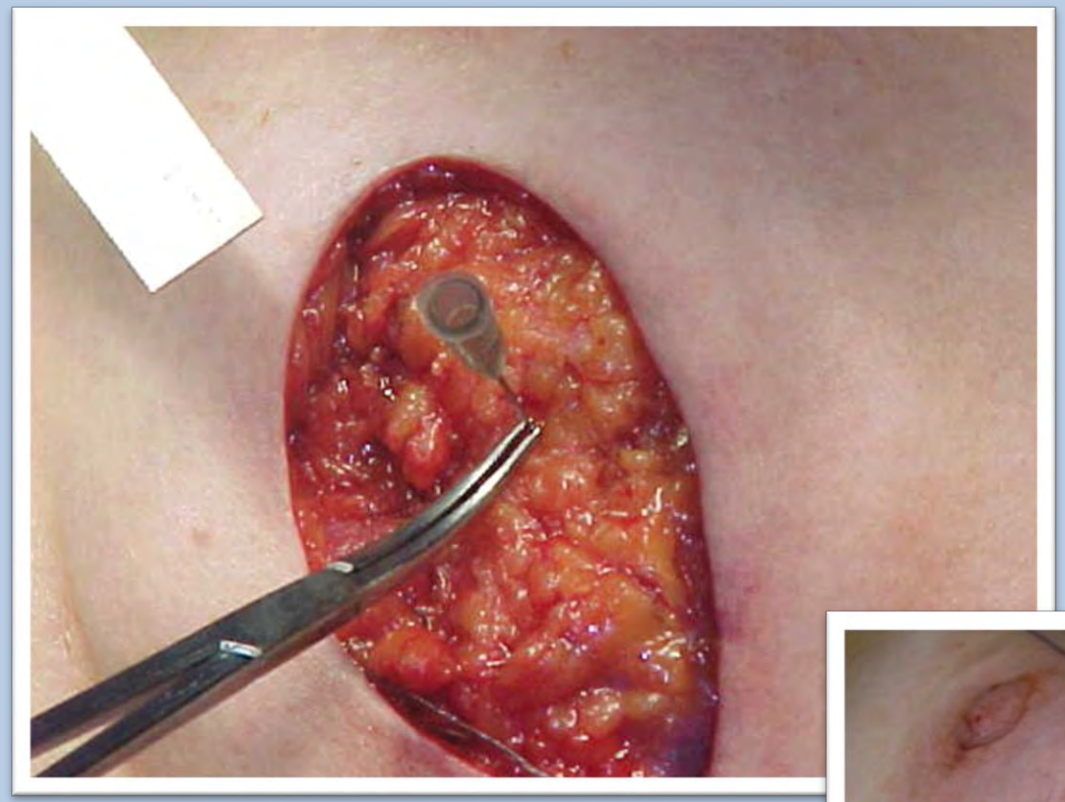
Breast gland reconstruction

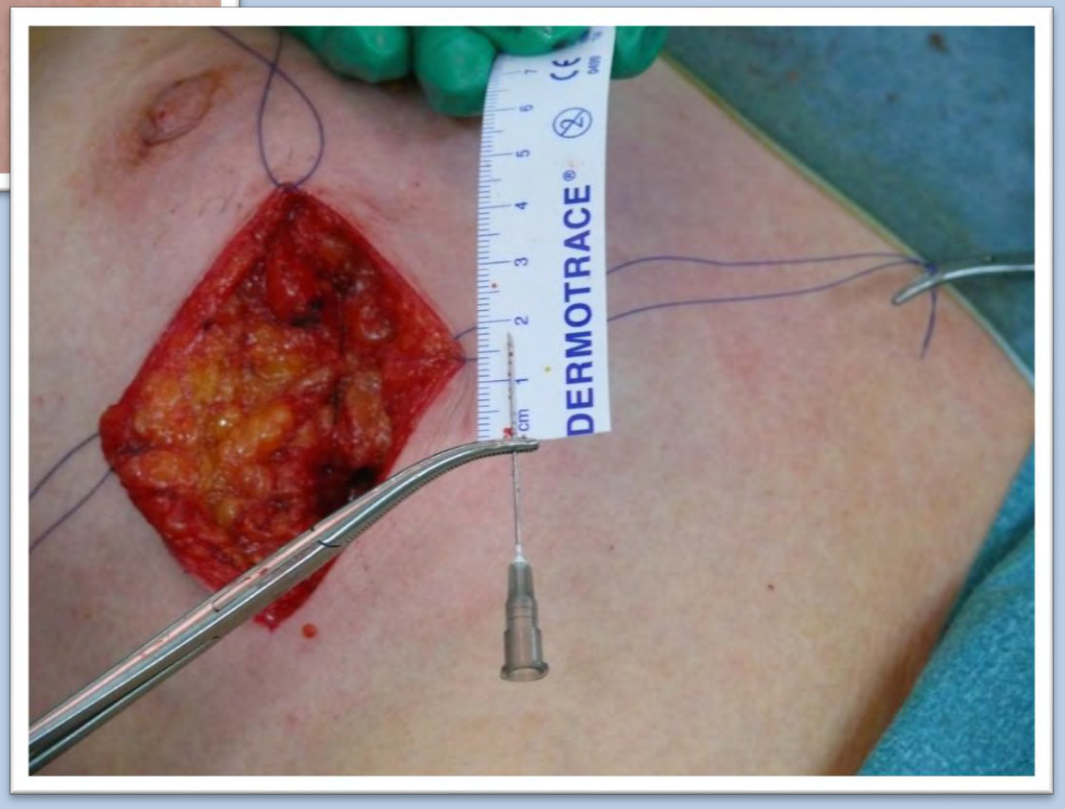
The gland is sutured by temporary separated stitches in one single plane, taking the entire thickness of the breast. The final result is the perfect restoration of the anatomy and of the thickness of the gland, with the protection of the thoracic wall lying under the gland.

Breast gland reconstruction



The third step: breast gland thickness measurement and collimator placement





DERMOTRACE®
cm

Collimator placement

The collimator of the LINAC is introduced through the skin incision and placed directly in contact with the breast target. The skin margins of the surgical incision are everted out, far from the target. The portion of the breast that needs to be irradiated (clinical target volume) is an area of 4 to 5 cm of minimum diameter around the cancer resection site but, depending on the breast size, the cancer localization, and the technical possibility of mobilizing the gland, it is possible to irradiate up to 10 cm of the breast parenchyma.

Collimator placement

The collimator is placed directly in contact with the breast gland. Great care should be taken to avoid the involuntary creation of an herniation of the gland into the collimator, the result in this case could be an increase in the dose delivered to the superficial part of the target.

Connection to the LINAC

The remote control of the LINAC allows the gentle movement of the machine in every direction. The radiation technologist moves the LINAC, and the connection to the distal part of the applicator is performed in the exact position chosen.

Connection to the LINAC

The fourth step: RADIOTHERAPY

ELIOT

(**EL**ectron **I**ntra **O**perative **T**herapy

Full dose (21Gy) or BOOST (12Gy) in three minutes

IEO Arc

IEO Istituto Europeo di Oncologia

Removal of ELIOT Devices and Wound Synthesis

After the delivery of the radiation dose, the collimator is immediately removed from the surgical breach, and the LINAC is placed far from the operating table. The suture of the gland is partially or completely undone to allow the removal of the disks. The gland is then reconstructed again, being the reconstruction facilitated by the previous breast mobilization that created glandular flaps.

Result

Good cosmetic outcome
(RTOG/EORTC)

ELIOT: advantages

- Collimator is placed under the direct control of the surgeon, and the dose – intensity evaluation is made by the radiotherapist and physicist directly there.

Advantages of ELIOT

<u>Short irradiation</u>:

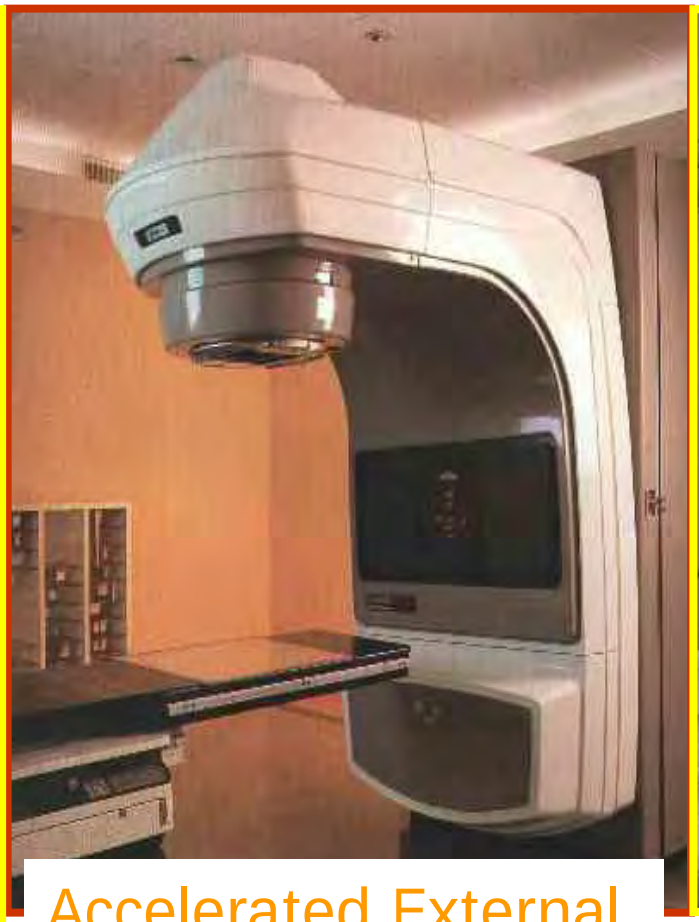
-Unique dose (21 Gy) vs. 6 weeks of fractionated doses (50+10Gy)

-The problem of the difficult access to radiotherapy centers is solved

Advantage: to avoid delay of radiotherapy

Surgery + ELIOT boost

1



Accelerated External Radiotherapy

21

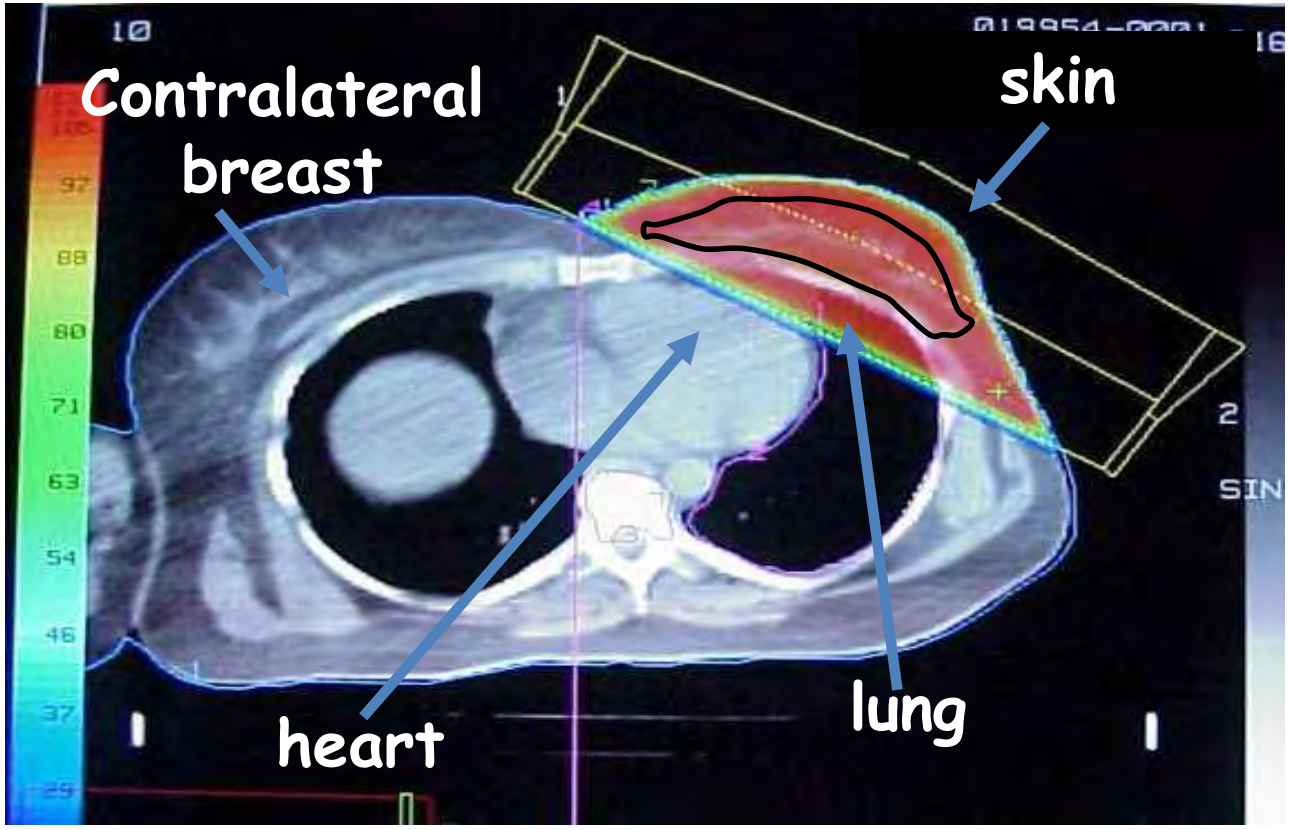
days

Systemic treatments

34-38

Advantages of ELIOT

Radiation exposure to the skin, subcutaneous tissue, lung, heart and contralateral breast is dramatically reduced



External RTP: contraindications

- Hodgkin Disease
- Severe cardiopathy
- Additive mastoplasty
- Skin lesions
- Previous RTP for breast cancer

IEO Arc

… conclusion

Indication for ELIOT

- Biological evaluation
- Breast dimension and tumor site
- Type of skin incision
- Additive prosthesis
- Type of collimator and disks
- Cosmetic result

MOBILE LINEAR ACCELERATOR FOR IOERT:

DOSIMETRIC AND TECHNICAL ASPECTS

Comi Stefania

Medical Physics Department

European Institute of Oncology, Milano

Novara 24 June 2016

LIAC 001

A mobile dedicated linac for IORT, working in an existing OR

Electron beams (4,6,8,10 MeV) (4 energy levels) with high dose/pulse values

LIAC 023

A mobile dedicated linac for IORT, working in an appropriate shielding OR

Electron beams (6,8,10,12 MeV) (4 energy levels) with high dose/pulse values

Dose rate: 3-40 Gy/min

hard-docked, transparent PMMA applicators

QUALITY ASSURANCE PROTOCOL

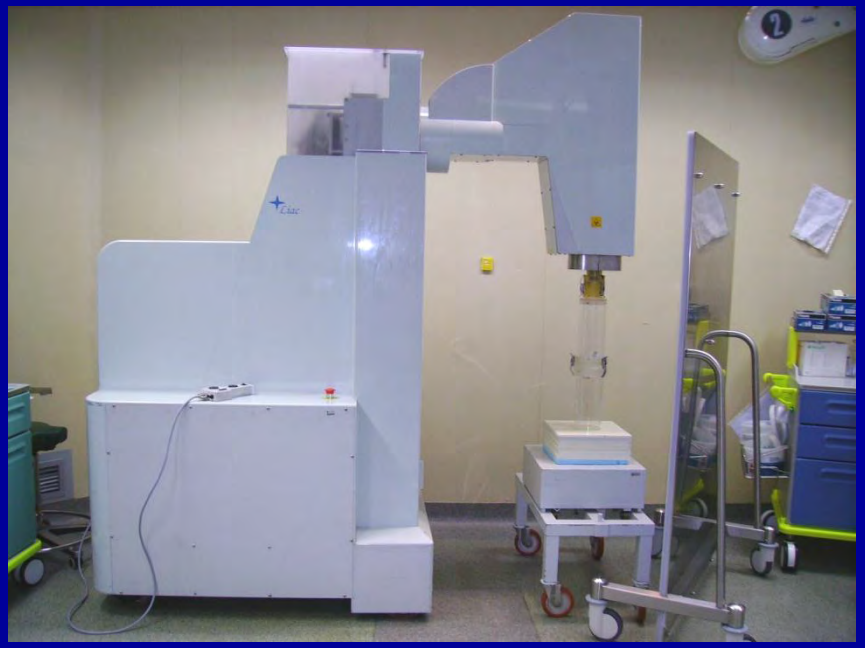
- ✓ QA program modified from those developed for conventional linacs
- ✓ Specific features of LIAC and RP limitations in the OR

Daily checks (in the 12 hours before treatments)

PARAMETER	TOLERANCE LEVEL	EQUIPMENT
safety systems, warning devices, mechanical movements	functional	= =
dose monitoring system: constancy	2%	flat chamber in solid phantom

PARAMETER	TOLERANCE	EQUIPMENT
Monthly checks		
radiation beam energy	2 mm @ D80%	verific. films in solid ph.
flatness and symmetry	10% (flatness); 3% (symmetry)	verific. films in solid ph.
dose monitoring system: short-term reproducibil.	1%	flat chamber in solid ph.
status of accessories	not damaged	= =
6-monthly checks		
dose monitoring system: linearity	2%	flat chamber in solid ph.
stray radiation	as low as possible	radiation monitor, film badges, TLDs
Yearly checks		
photon contamination	< 1%	verific. films in solid ph.
beam dose calibration	2%	MD-55-2 films in solid ph., Fricke dos. in water (2 yrs)

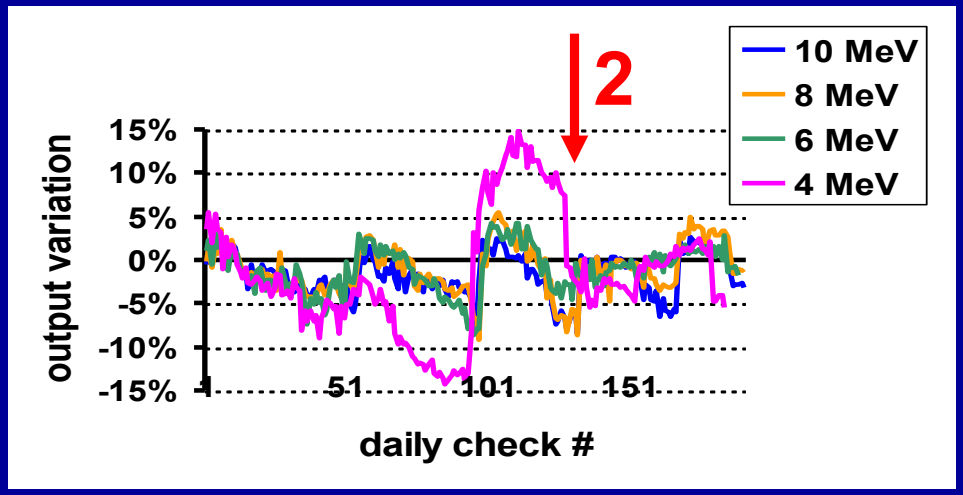
Analysis of dose output long-term stability



- Dec 04 – Jul 07: 182 daily checks (4 energies)
- PTW Roos flat ion chamber
- mean variation and 1 SD

Daily output variations (%)

	overall	after upgrade 2
4 MeV	-1.6 ± 6.9	-1.5 ± 2.3
6 MeV	-1.1 ± 2.7	-0.3 ± 1.3
8 MeV	-1.0 ± 2.9	-0.0 ± 2.4
10 MeV	-1.8 ± 2.5	-1.1 ± 2.5



SD (%)

Liac : ~ 2 - 2.5 (1 yr)

- Liac vs conventional linacs (and Mobetron): lower stability as a price to pay for high mobility and compactness, as well as use of high dose/pulse beams
- Severe QA program, including preventive maintenance at a regular basis, is mandatory in the clinical practice!

Internal shieldings

Which type of disks?

Electron backscatter effect from lead		
10 MeV	at interface	1.58
	5 mm RW3	1.18
	10 mm RW3	1.00
	2 mm Al	1.24
	4 mm Al	1.11

We use: 2 mm Lead + 4 mm Aluminium

Shielding transmission LIAC 023

Disc	Nominal energy			
	6 MeV	8 MeV	10 MeV	12 MeV
2mmPb+4mmAl	0,37%	0,66%	1,32%	2,13%

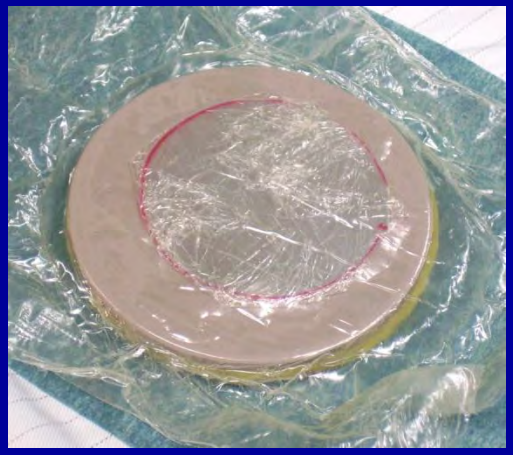
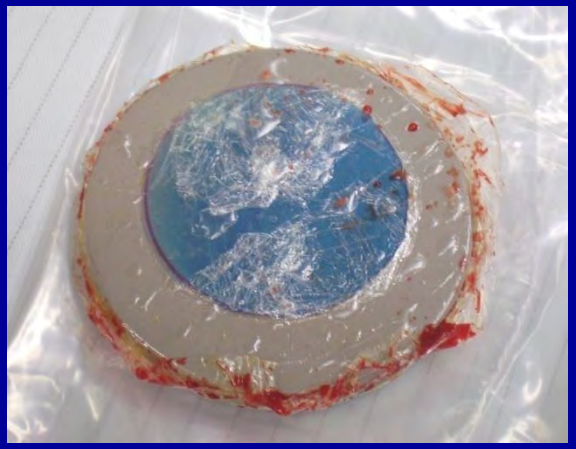
IN VIVO DOSIMETRY : recent developments

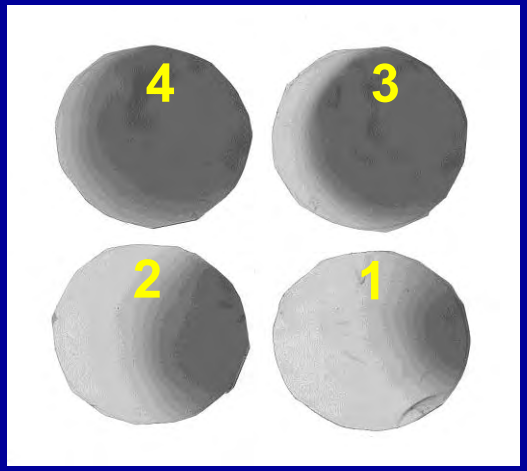
• **entrance dose** (at d_{max}) derived from surface dose measurement (2 **small** films)



• **exit dose**: 1 **large area** (Ø 4 cm) film on top of Pb/Al shielding disc (inserted between mammary gland and pectoral muscle)

Measured vs expected dose (based on isodose chart and gland thickness measured by surgeon using a needle and ruler)





Evaluation of disk alignment: score 1 (bad) to 4 (excellent)

Alignment of the shielding disk

	all pts	larger disks*
score 1	2/35 (6%)	=
score 2	10/35 (29%)	1/7 (14%)
score 3	15/35 (43%)	2/7 (29%)
score 4	8/35 (23%)	4/7 (57%)
score 3+4	23/35 (66%)	6/7 (86%)

* : disk diameter > 6 cm (6.5-7 cm)

MOST IMPORTANT RADIATION PROTECTION ITEMS

- positioning of protective barriers around operating table (building 1)

or

- positioning of accelerator with respect to floor protection (building 2)

- Nobody in the OR during irradiation

Nobody in the dirty corridor during irradiation^:

an audible alarm and a signal light are activated 30 s before irradiation start

^ or in the patient preparation / operators' washing room (building 1) except operators at the treatment console

Special IORT applications in breast patients

1. Pregnant women

2. Cardiac implantable electronic devices carriers

Pregnant women

Is electron beam intraoperative radiotherapy safe in pregnant women with early breast cancer?

In vivo dosimetry to assess fetal dose

A couple of TLDs were positioned on non pregnant patients skin in 4 different positions and in uterus

Prescribed dose	Right ovary	Left ovary	Suprapubic	Sub-diaphragmatic	Uterus
Gy	mGy	mGy	mGy	mGy	mGy
21	0.925	1.001	0.776		0.57
21	0.453	0.443	0.384	1.639	0.3
12	0.677	0.557	0.435	2.902	0.366
21	0.881	0.814	0.682	1.98	0.485
12	0.314	0.293	0.576	7.758	0.261

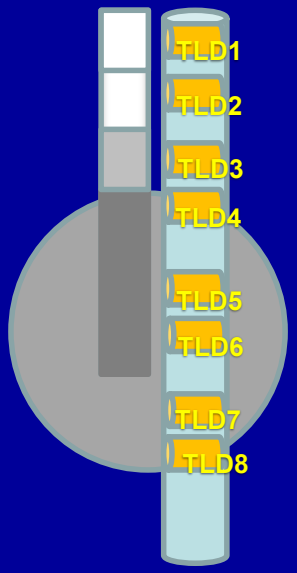
In December 2011 a pregnant woman, affected by early stage breast cancer, underwent conservative surgery and ELIOT full dose (21 Gy at 90% isodose) during the 15th gestation week

Comparing the data on the skin between non pregnant women and the pregnant one, we evaluated that the expected dose to the foetus should have been 0.84 mGy

ELIOT offers the pregnant woman the choice of receiving breast-conserving surgery, without exposing her baby to a significant radiation risk, and preserves her breast

Cardiac implantable electronic devices carriers

Two catheters with 8 TLDs



The first catheter was attached to the thoracic shielding

The catheter tip was positioned in the subclavicular region, where a cardiac device would be placed

The second catheter was placed on the patient skin, parallel to the first one, next to the applicator

ELIOT seems to be safe for patients using cardiac devices as long as the minimum distance of 2.5 cm is kept between the cardiac device edge and the applicator wall

Conclusions

Work in progress:

- **TPS for IORT**
- **In vivo dosimetry**

Biomolecular predictors for IBR ?

The role of mi-RNA

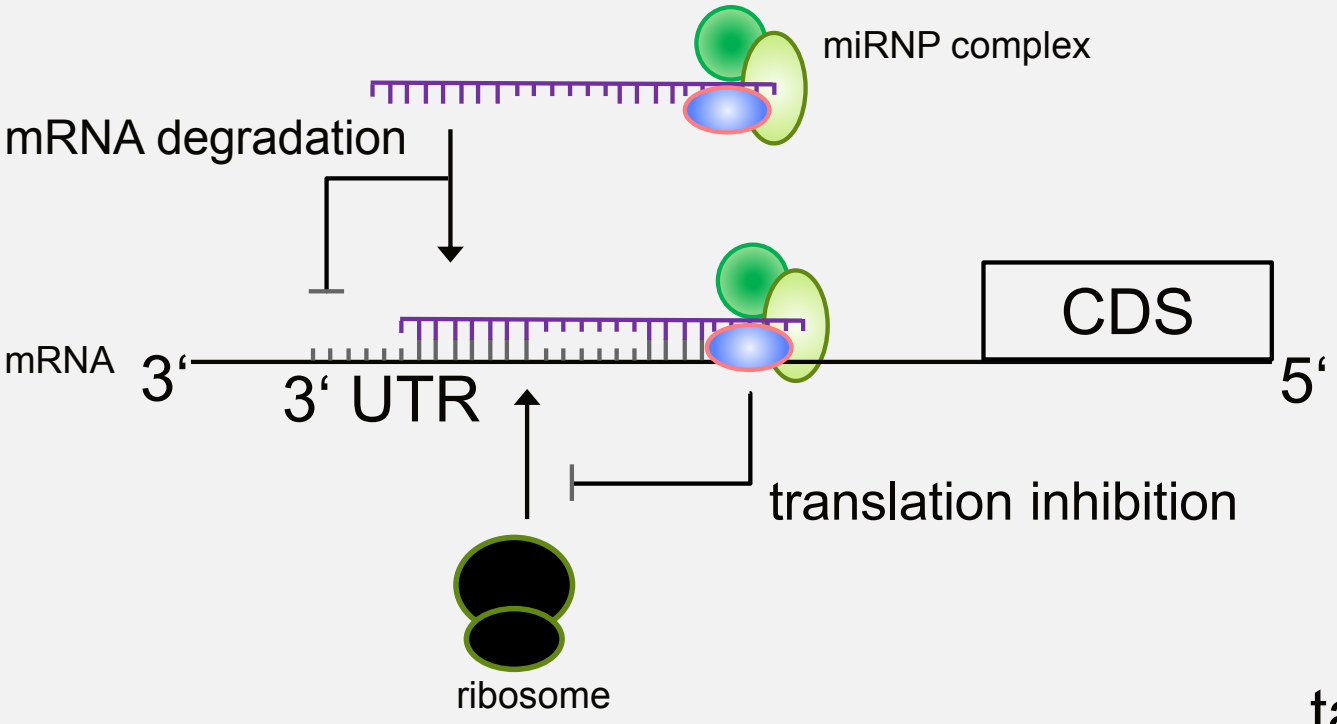
- **What** are miRNAs (miRs, microRNAs)?
  - Small non-coding RNAs (20-25 nucleotides)

- What is the **biological function** of miRs?
  - Blocking of translation by miR-mRNA-binding

- What could be **the role** of miRs in cancer tissue / patients?
  - Oncogene
  - Tumor suppressor

Biomolecular predictors for IBR ?

The role of mi-RNA



target protein

3‘ UTR… untranslated region
CDS… coding sequence

The role mi-RNA

Aim

- **To identify miRs** that predict local control in early stage breast cancer patients after breast conserving therapy

Study design: retrosp.matched-pair 147 patients, early stage

- **Pilot study** (microarray, 1200 miRs): 16 patients with local relapse versus 16 controls without local relapse
- **Validation study** (RT-qPCR, 8 miRs): 30 patients with local relapse versus 85 patients without local relapse
- **FFPE samples** of the resected untreated tumor

The role mi-RNA

Method: Fold change (fc)

Definition: fc is a measure for the different expression levels of two molecules measured by PCR

Pilot: miR-pattern distinguishes relapse from control patients

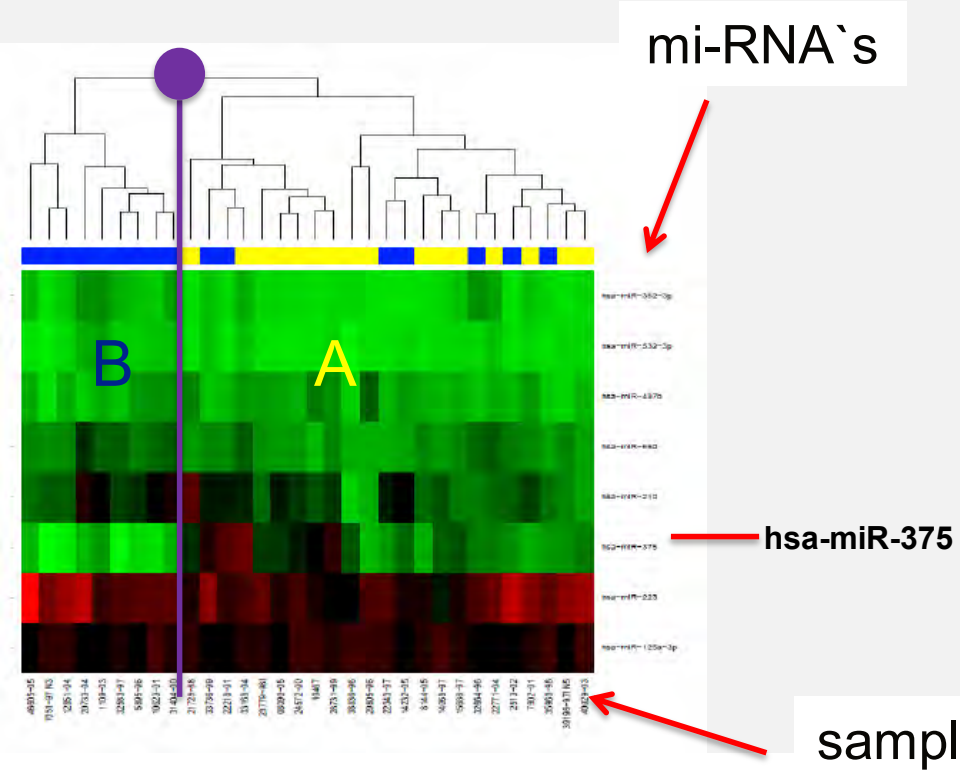


Figure 1
By means of hierarchical clustering a heat-map was generated. The dendrogram on top depicts the grouping of patients according to their pattern of candidate miRs **(yellow: patient with local relapse; blue: patient without local relapse).** The intensity values of a given miR are shown in **green (low intensity)** and **red (high intensity).** On the right side the eight candidate miRs are listed. At the bottom the sample numbers are shown. The first knot in the dendrogram separates a group of patients **without relapse (pattern B)** from the **rest of the cohort (pattern A).**

The role mi-RNA

Pilot: predictive value of the pattern verified in 32 patients

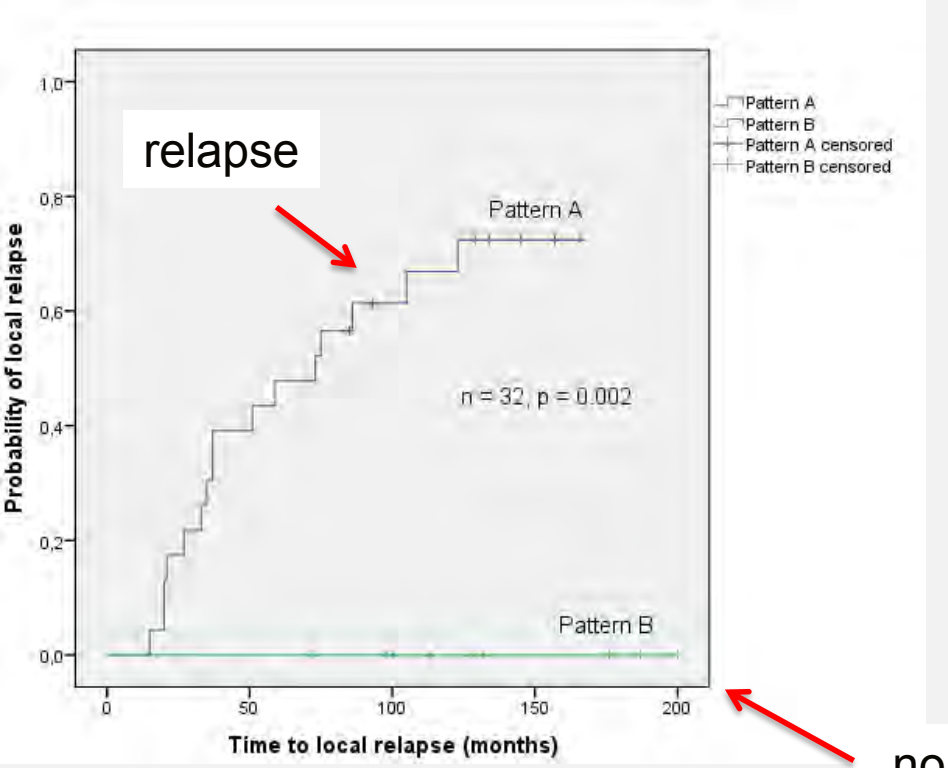

Figure 2
This plot shows the log-rank comparison of **pattern A versus pattern B**. The pattern of **eight miRs** (hsa-miR-362-3p, hsa-miR-532-3p, hsa-miR-487b, hsa-miR-660, hsa-miR-210, hsa-miR-375, hsa-miR-223, hsa-miR-125a-3p) was able to differentiate between relapse group and control group.

The role mi-RNA

Pilot: *MiR-375* is the most prominent single miR in the pattern

expression level of „hsa-miR-375“

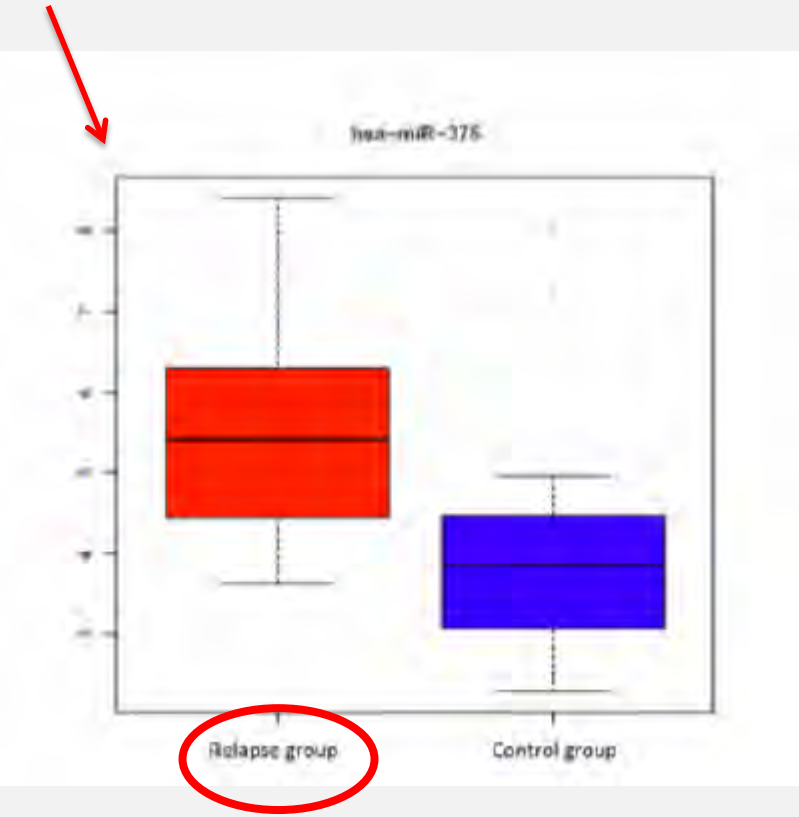

Figure 3:
The most prominent single miR that could differentiate relapse from control patients was **hsa-miR-375** (LIMMA, raw p-value 0.009). The box plot shows relapse versus control group, the expression values of hsa-miR-375 are shown on the y-axis.

The role mi-RNA

Validation: predictive value of hsa-miR-375 verified in 115 patients

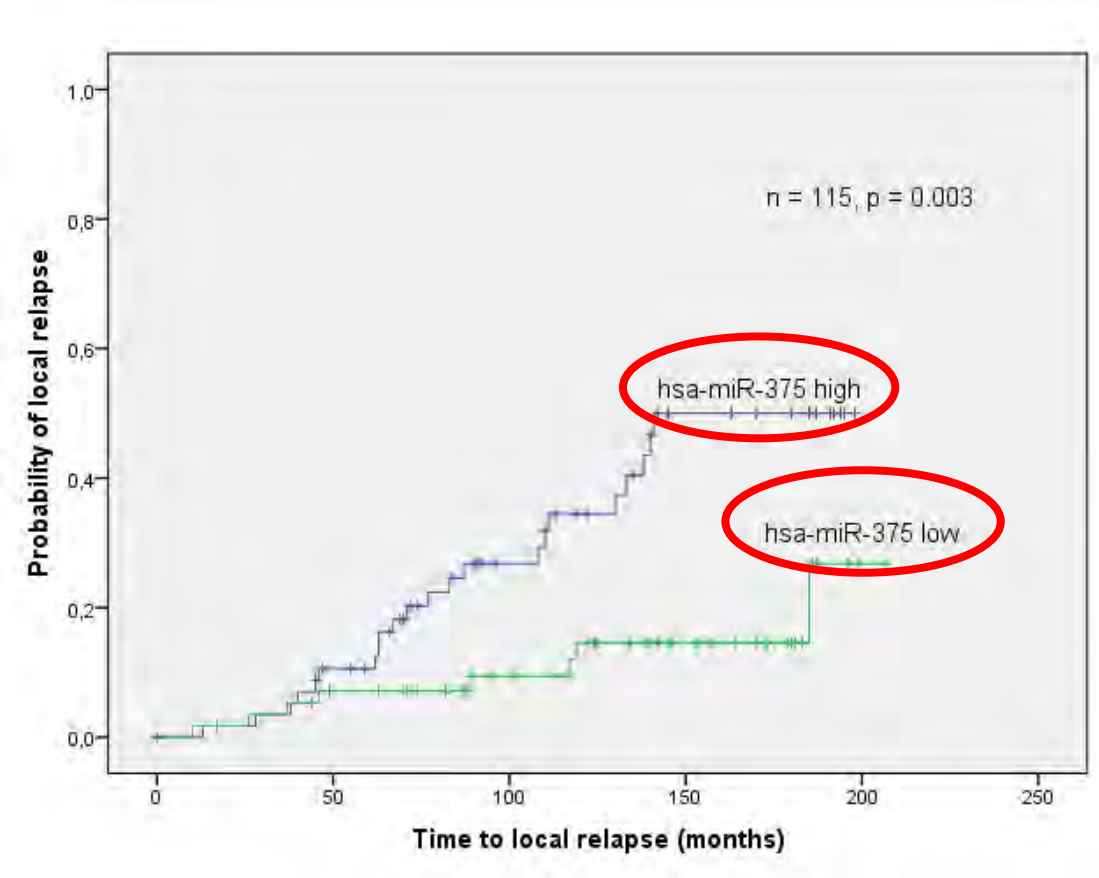

Figure 5:
In a time-to-event analysis (event = local relapse) hsa-miR-375 was able to separate the relapse from the control group (log-rank p = 0.003): **high expression levels were correlated with a higher probability of local relapse.**

The role mi-RNA

Zehentmayr et al. Clinical Epigenetics (2016) 8:28
DOI 10.1186/s13148-016-0198-1

Clinical Epigenetics

RESEARCH Open Access

Hsa-miR-375 is a predictor of local control in early stage breast cancer

Franz Zehentmayr[1,2*], Cornelia Hauser-Kronberger[3], Barbara Zellinger[2,3], Falk Hlubek[5], Claudia Schuster[5], Ulrich Bodenhofer[6], Gerd Fastner[1], Heinz Deutschmann[1,2], Philipp Steininger[2], Roland Reitsamer[4], Thorsten Fischer[4] and Felix Sedlmayer[1,2]

Further steps:

- identification of target genes for hsa-miR-375
- changes in microRNA profiles in woundfluid after IOERT (HIOB-trial)

Conclusion

Growing scientific visibility of biological efficacy higher dosages:

- *influence on wound fluid* to impair cell ploriferation
- *immunological effects* (cytokine induction, Antigene presentation)
- *antiangiogenic effects* (endothelial apoptosis, thrombus formation)
- *Repair saturation of DNA-damages* by increasing single dosages

Histological predictors - LR:

Without PST:
- G3
- BC-subtypes: TN, non-luminal

After PST:
- G3 ER neg
- TN KI67≥ 15%
- age < 50
- cT: at least ≥ 2 cm
- stage III
- res. multifocality disease in the breast
- no pCR (breast a/o nodes)
- higher cN+ (N2-3)

Biomolecular predictors - LR:

mi-RNA:
- hsa-miR-375

Further steps:
- Testing for target genes
- Testing mi-RNA profiles in the woundfluid

Impact of Lymphovascular Space Invasion, Extensive Intraductal Component, and Multifocality on Outcomes Following Accelerated Partial Breast Irradiation

M.S. Jawad, J.B. Wilkinson, C. Shah, J. Wobb, B. Stone, A. Fowler, C.K. Mitchell, M. Wallace, P.Y. Chen, and I.S. Grills; *William Beaumont Hospital, Royal Oak, MI*

Materials/Methods: Between 1993 and 2011, 692 patients with early-stage breast cancer were treated with APBI at a single institution, receiving either interstitial brachytherapy (n = 195), balloon-based brachytherapy (n = 292), or 3D-CRT (n = 205) as part of breast conserving therapy.

Impact of Lymphovascular Space Invasion, Extensive Intraductal Component, and Multifocality on Outcomes Following Accelerated Partial Breast Irradiation

M.S. Jawad, J.B. Wilkinson, C. Shah, J. Wobb, B. Stone, A. Fowler, C.K. Mitchell, M. Wallace, P.Y. Chen, and I.S. Grills; *William Beaumont Hospital, Royal Oak, MI*

Materials/Methods: Between 1993 and 2011, 692 patients with early-stage breast cancer were treated with APBI at a single institution, receiving either interstitial brachytherapy (n = 195), balloon-based brachytherapy (n = 292), or 3D-CRT (n = 205) as part of breast conserving therapy.

R. Orecchia et al. Br J Radiol 2005 Jan;78(925):51-4.

Irradiation with standard tangential breast fields in patients treated with conservative surgery and sentinel node biopsy: using a 3-D tool to evaluate the first level coverage of the axillary nodes.

Dosimetric analysis of first axillary level coverage in standard irradiation of breast-cancer patients treated with quadrantectomy and SN biopsy.

The maximum dose mean ranged from 5% to 80% of the prescribed dose (mean value 48.7%). The mean total dose received by the volume of interest was lower than 40 Gy in all but one patient. No patient had total irradiation of first nodal level; only one patient had 35% of the volume enclosed in the 100% isodose.

Our analysis lead to the conclusion that therapeutic doses are not really delivered to first level axillary level nodes by a standard tangential field technique, and that specific treatment planning and beam arrangement are required when adequate coverage is necessary.

Ipsilateral axillary recurrence A comparison between WBI and ELIOT

IEO Data (2016, ready for submission)

- 4,129 consecutive patients (T≤2cm, SNb-)
- 1997-2007 (median follow-up 8.3 years)
- BCS and WBI (2,939) or ELIOT (1,190)
- More patients in the WBI group for:
  - young age (54.0 vs 59.1)
  - Extensive In situ Component
  - Er negative status
  - HER 2 overexpression

Sensitivity analysis (2016, ready for submission)

- 1:1 matched design study
- Matched for:
  - year of surgery
  - age
  - pT-stage

- 1,165 patients in WBI arm,
  1,165 in ELIOT arm

Multivariate analysis

		Axillary recurrence ± ipsilateral breast recurrence HR (95% CI)	Axillary recurrence without ipsilateral breast recurrence HR (95% CI)

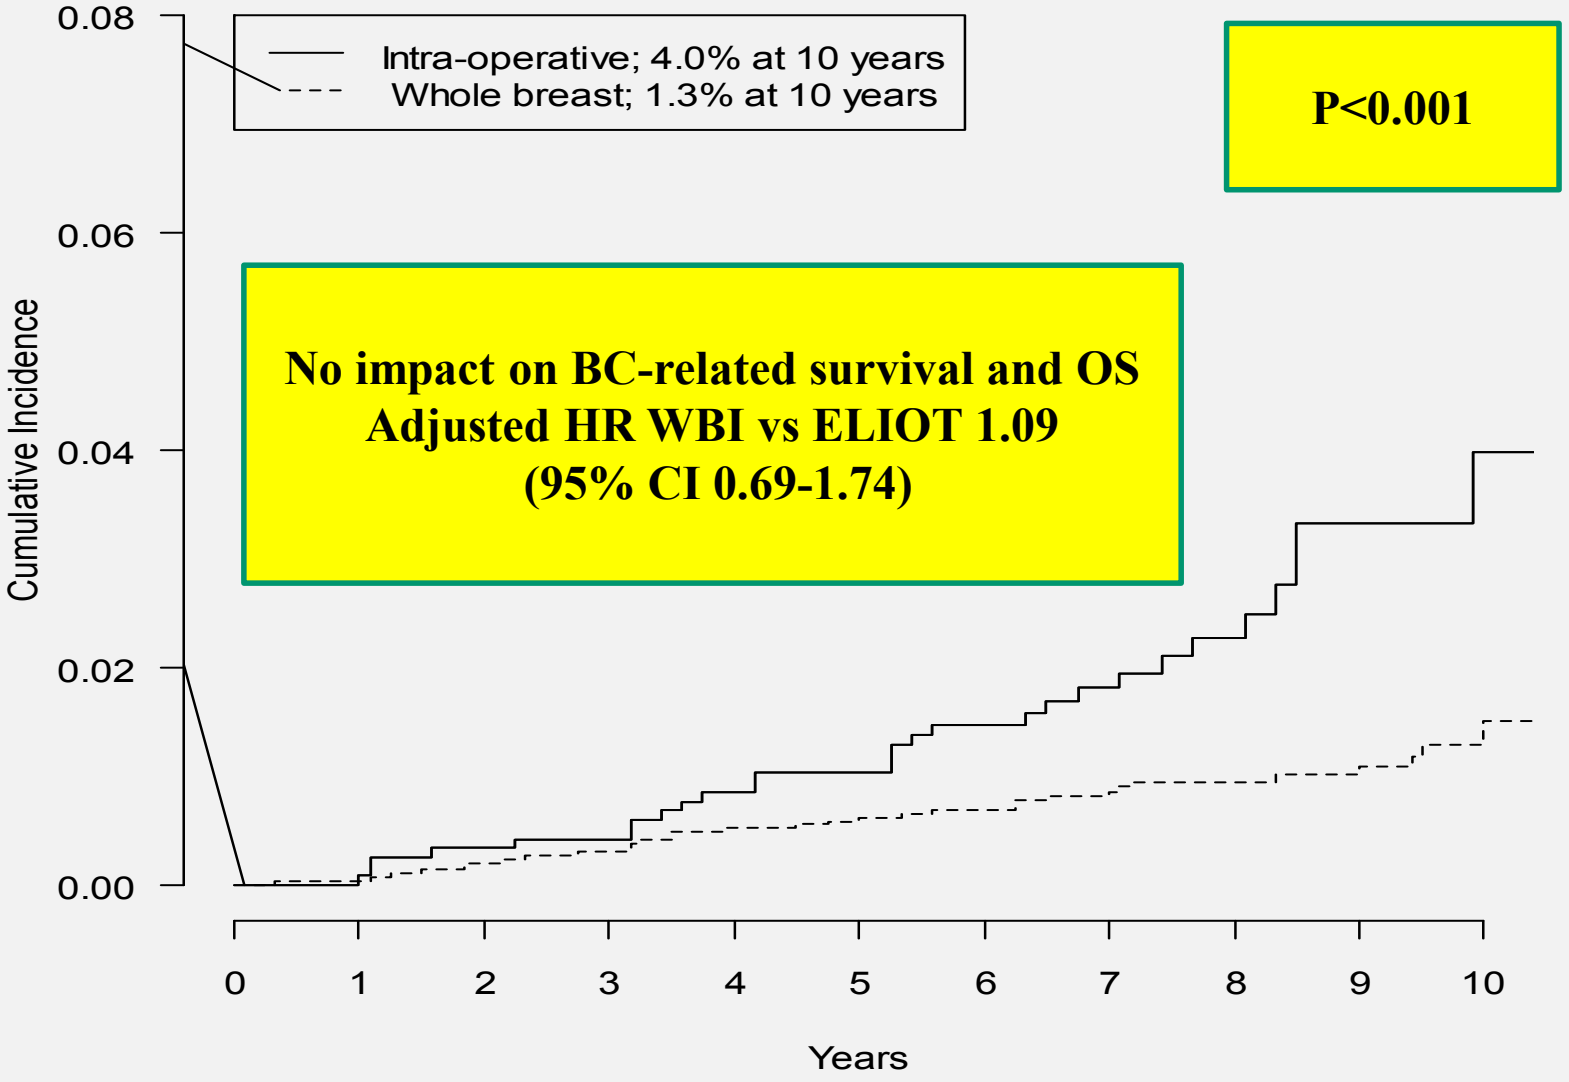
Peritumoral vascular invasion	Present vs absent	1.69 (0.89-3.19)	1.66 (0.74-3.77)
Type of radiotherapy	WBI vs. ELIOT	0.30 (0.17-0.51)	0.34 (0.17-0.71)

Risk of axillary recurrence



ELIOT. Toxicity

- **Overall, side effects showed a significant difference in favour of the ELIOT arm (p=0.0002)**

- **Few skin side effects in the ELIOT arm, including erythema (p<0.0001), dryness (p=0.04), hyper-pigmentation (p=0.0004) or pruritus (p=0.002). No differences for mammary fibrosis, mammary retraction, pain or burning.**

- **A higher incidence of fat necrosis was observed in the ELIOT arm with an incidence of 12% (p<0.04), mostly not symptomatic.**

- **A subgroup of 178 volunteers (95 from the ELIOT arm and 83 from the external RT arm) accepted to undergo a follow-up spiral CT-scan. Pulmonary fibrosis was diagnosed in 42 (23.6%) of the patients examined: 4 (10%) had received ELIOT and 38 (90%) external RT (p <0.0001). Twenty-six of these were grade 1 (1 in the ELIOT arm), 15 grade 2 (3 in the ELIOT arm) and one was grade 3 in the external RT arm.**

	External RT (n=654)		ELIOT (n=651)		
Person-years until last visit	3,920		3,716		
Person-years until last contact	4,107		3,997		
Other events	*Events*	*5-year event rate (95% confidence interval)*	*Events*	*5-year event rate (95% confidence interval)*	*Log-rank P value*
Distant metastasis*	35	4.8% (3.1-6.5%)	33	5.1% (3.3-6.9%)	0.94
Other primary cancer	22	3.2% (1.8-4.7%)	20	2.5% (1.2-3.8%)	0.88
Death as first event	7	0.9% (0.1-1.7%)	8	1.0% (0.1-2.0%)	0.69
Total deaths	31	3.1% (1.7-4.5%)	34	3.2% (1.7-4.7%)	0.59
Breast cancer	20	2.0% (0.9-3.2%)	23	2.1% (0.9-3.3%)	0.56
Other cause	11	1.1% (0.2-2.0%)	11	1.1% (0.2-2.0%)	0.93

Conclusions

- **ELIOT studies allowed to identify a low risk group suitable for PBI techniques, with no significant difference in terms of LRR**
- **T-size, N-status, Tumor Grade and Molecular Subtypes are the most important predictive factors**
- **The absolute risk of LR and RR remains in any case low, with no impact on survival at 10 years**

Targeted intraoperative radiotherapy versus whole breast radiotherapy for breast cancer (TARGIT-A trial): an international, prospective, randomised, non-inferiority phase 3 trial

www.thelancet.com Published online June 5, 2010 DOI:10.1016/S0140-6736(10)60837-9

THE LANCET

"For selected patients with early breast cancer, a single dose of radiotherapy delivered at the time of surgery by use of targeted intraoperative radiotherapy should be considered as an alternative to external beam radiotherapy delivered over several weeks."

It works!

UMM UNIVERSITÄTSMEDIZIN MANNHEIM

Medizinische Fakultät Mannheim der Universität Heidelberg

Universitätsklinikum Mannheim

INTRABEAM® : Main System Components

Universitätsklinikum Mannheim

“Targit dose”

Depth doses

- measured in Zeiss factory using water tank
- dose rate with depth for probe only
- Dose rate calculation based on PTW chamber calibration factor for **exposure**

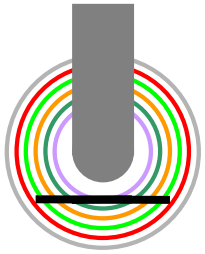
IC: PTW Type 23342

Courtesy by Zeiss

“Non-Targit dose”

Depth doses

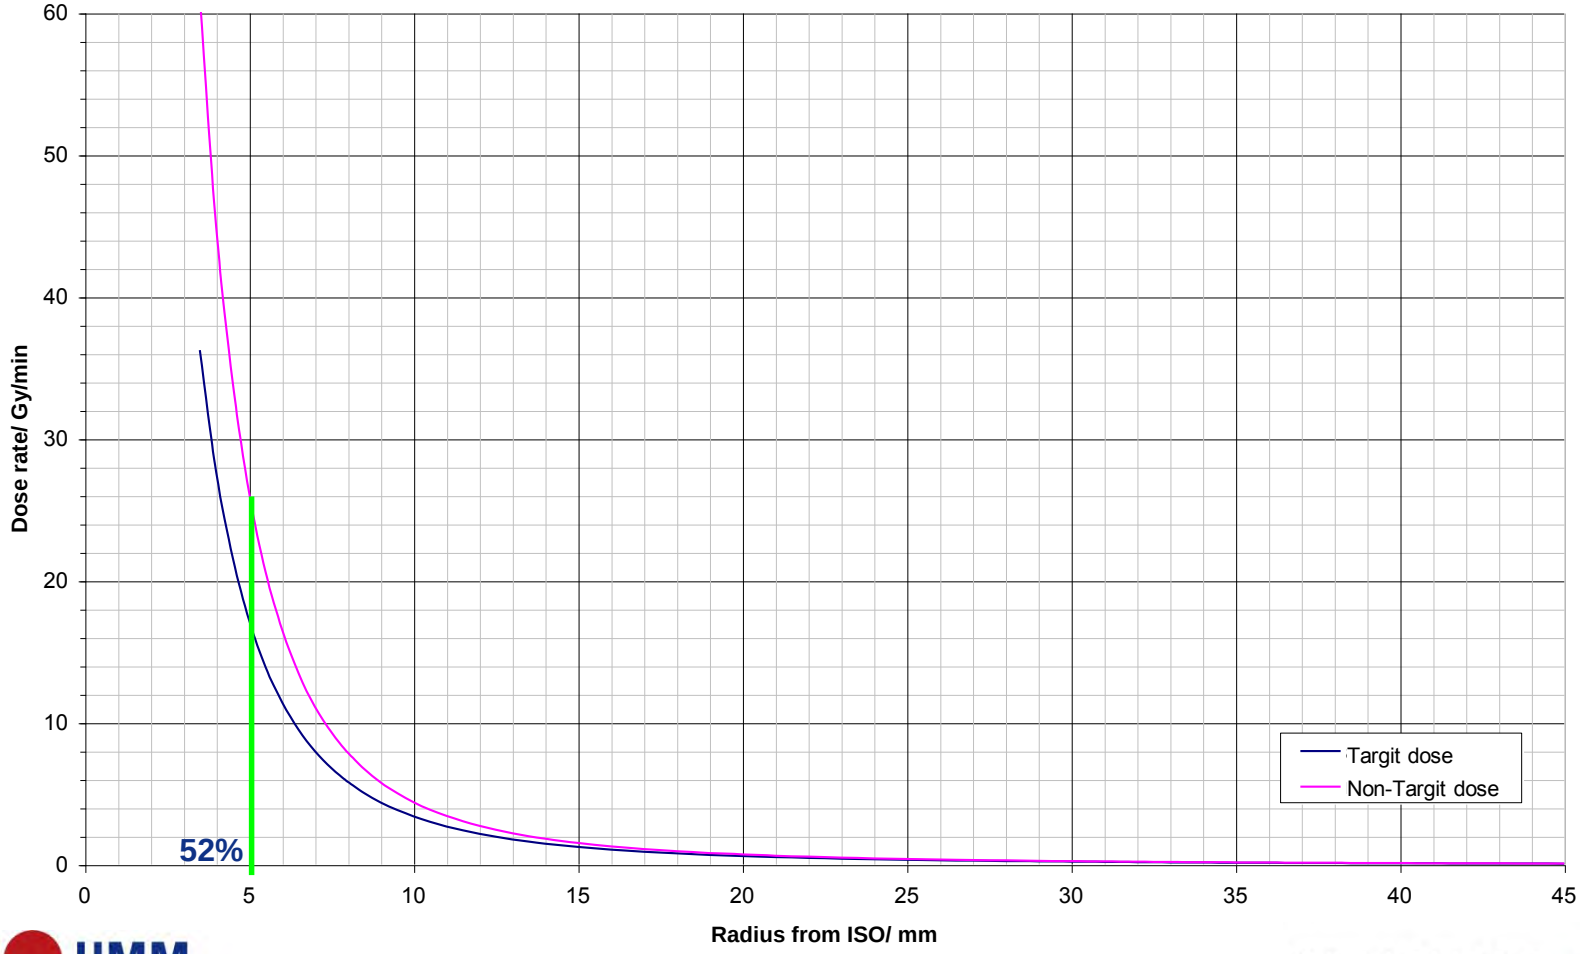
- measured in Zeiss factory using water tank
- dose rate with depth for probe only
- Dose rate calculation based on PTW chamber calibration factor for **air kerma** (recommended by AAPM TG61and IAEA TRS 398)



IC: PTW Type 34013

Why “Non-Targit dose”?

- State of the art !
- More precise dose (dose rate) in the near field of the probe



How does this affect the breast treatments?

ZEISS CARL ZEISS MEDITEC

Calibration Certificate

System:	**XRS**
Manufacturer:	Carl Zeiss Surgical GmbH
Type:	304534-7000-001
Serial No.:	507155
Work order No.:	1022778574

This certificate verifies that said object maintained its specified values during calibration. Calibration was carried out using calibration tools/working standards that are directly or indirectly based on recognized calibration methods traceable to national standards.

The calibration system is specified in the Carl Zeiss QA manual as per DIN/ISO 9001 or EN 29001.

Date of Calibration: 7. Jun. 10

Responsible person: CG-QM 12

Person in charge: CG 525

Due date for next Calibration: 7. Jun. 11

The customer is responsible to check for different calibration due date according to national regulations or standards.

Radiation protection measurement – IORT vs. C-arm

Yearly dose in 2 m distance
(example: 1 per day; 5 per week; 52 weeks = 260 treatments):

C-arm fluoroscopy (varying positions):

- Average simulated treatment: 56 – 467 µSv/h
- Average patient treatment: 95 µSv/h x 260 x 0.25 h = **6.2 mSv**

Kypho-IORT (varying treatment depth):

- Average simulated treatment: 66 – 141 µSv/h
- Average patient treatment: 131 µSv/h x 260 x 0.1 h = **3.4 mSv**

Breast-IORT (with Pb 0.175 mm tungsten rubber):

- Average simulated treatment: 27 µSv/h
- Average patient treatment: 46 µSv/h x 260 x 0.5 h = **6.0 mSv**

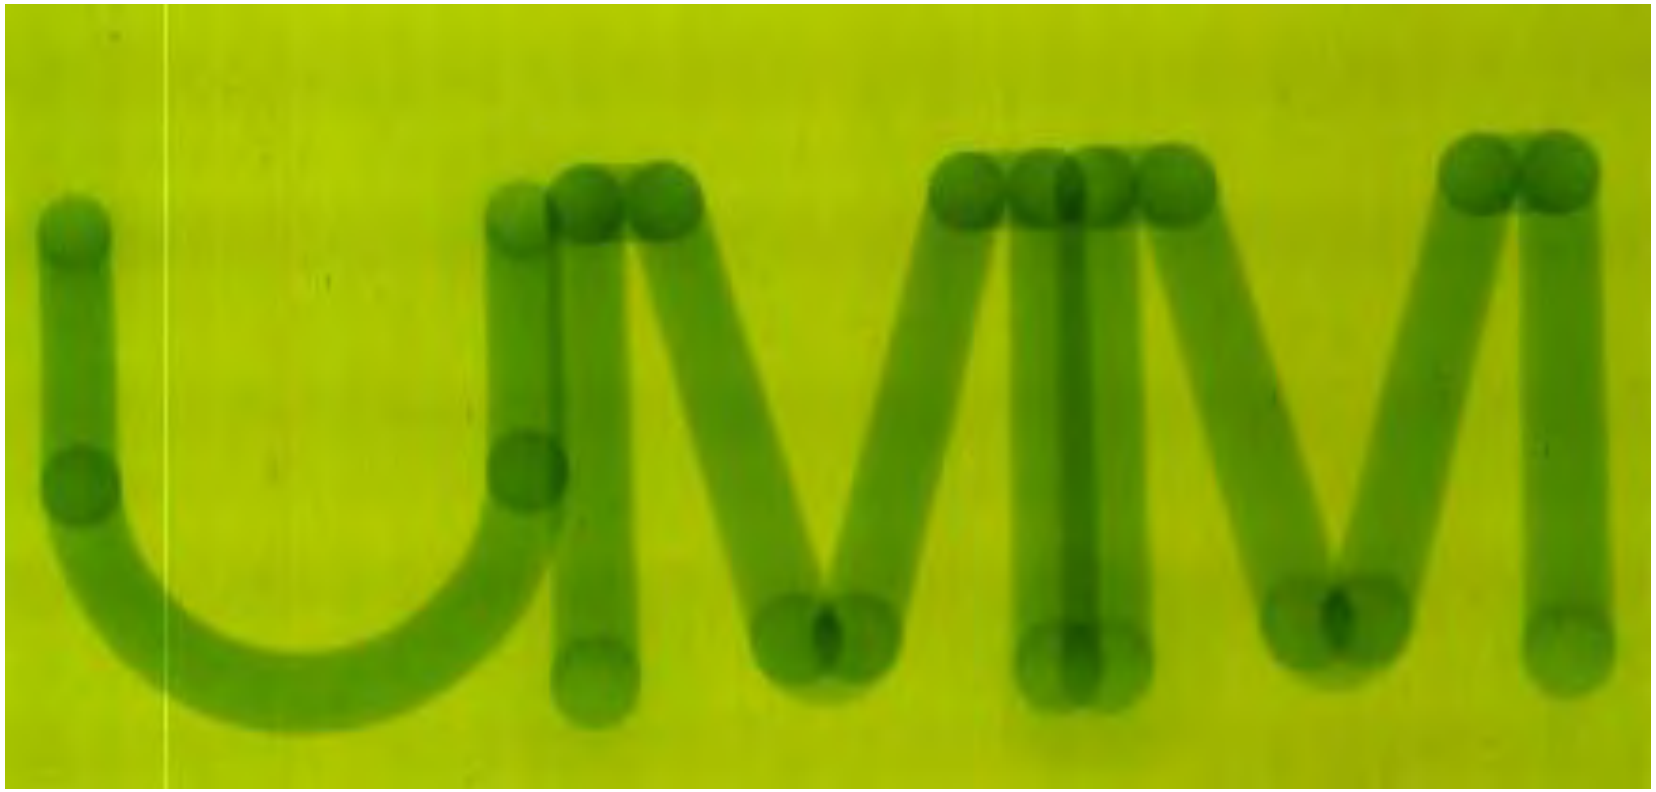
Take home points

- ➔ Radiation protection is straight forward
- ➔ Flexible clinical use (different applicators, no fixed treatment rooms)
- ➔ Treatment planning will open a wide new field in kV IORT
- ➔ kV IORT is a huge playground for medical physicists; there is always something to investigate



Thank you for your attention

2.1 Pubmed research – IORT with electrons

Author	Journal	Year	Topic	Design	N=	F/U	Result
Electrons				R=Retrospective, P=Prospective			
Wang X	Oncotarget	2015	IOERT in Chinese Han population	R	50	Median 51.8 months	IOERT is safe and reliable, very acceptable cosmetic results (Mobetron)
Kawamura M	Radiat Oncol	2015	Phase I/II trial 19,20,21Gy	P	32	Median 6 years	IOERT well tolerated in Asian population, no recurrence, 24% hypertrophic scarring
Massa M	Plast Reconstr Surg Glob Open	2015	Aesthetic evaluation in oncoplastic BCS	P	96	35-62 months	Excellent cosmetic results and high patient satisfaction
Cracco S	Breast J	2015	Cosmesis, acute complications after oncoplastic BCS	R	192	Mean 17 months	IOERT safe, fast, feasible, no difference in cosmesis
Robatjazi M	Phys Med	2015	Gafchromic EBT2 films	Physics	10	n/a	EBT2 films can be used for patient-specific QA in vivo for IOERT

2.2 Pubmed research – IORT with kV x-rays

Author	Journal	Year	Topic	Design	N=	F/U	Result
kV x-rays				R=Retrospective, P=Prospective			
Ebner F	Arch Gynecol Obstet	2016	IORT Boost: Seroma production	R	152	Acute toxicity	No increased seroma production after IORT
Coombs NJ	BMJ Open	2016	Social benefits	R	485	n/a	TARGIT reduces travel time/has environmental benefits
Valente SA	Ann Surg Oncol	2016	Consolidation of data in the US	R	822	Median 23.3 months	In breast recurrence 2.3%, rising use of IORT
Ebert MA	Radiat Res	2016	Radiation dama repair	Biology	n/a	n/a	Uncertainties of ex vivo samples
Fabris L	Oncogene	2016	miR-223, EGF pathway	Biology	29	n/a	Up-reg miR-223 decreases EGF pathway and impairs proliferation of breast cancer cells
Zur M	J Surg Oncol	2016	Acute toxictiy	P	395	Tox within 1y	IORT is safe (grade III-IV complications in 5%)
Rivera R	Breast J	2016	TARGIT for DCIS	P	35	36 months	Local recurrence 5.7%, Overall Survival 100%
Jalaguier-Coudray A	Eur J Radiol	2015	Radialogic findings	Radiology	271	6 months	Atypical calcifications = BIRADS 2, corresponded on tungsten deposits
Abbott AM	Am J Surg	2015	IORT >/< 70 years	R	100	24 months	Local recurrence 2%, low wound infection rates, no age difference
Wuu CS	Radiat Prot Dosimetry	2015	RBE, dosimetry	Biology	n/a	n/a	Low-dose RBE and clinically relevant RBE are presented, RBE of IORT ranges between 1.38 – 2.29

Social and economical aspects

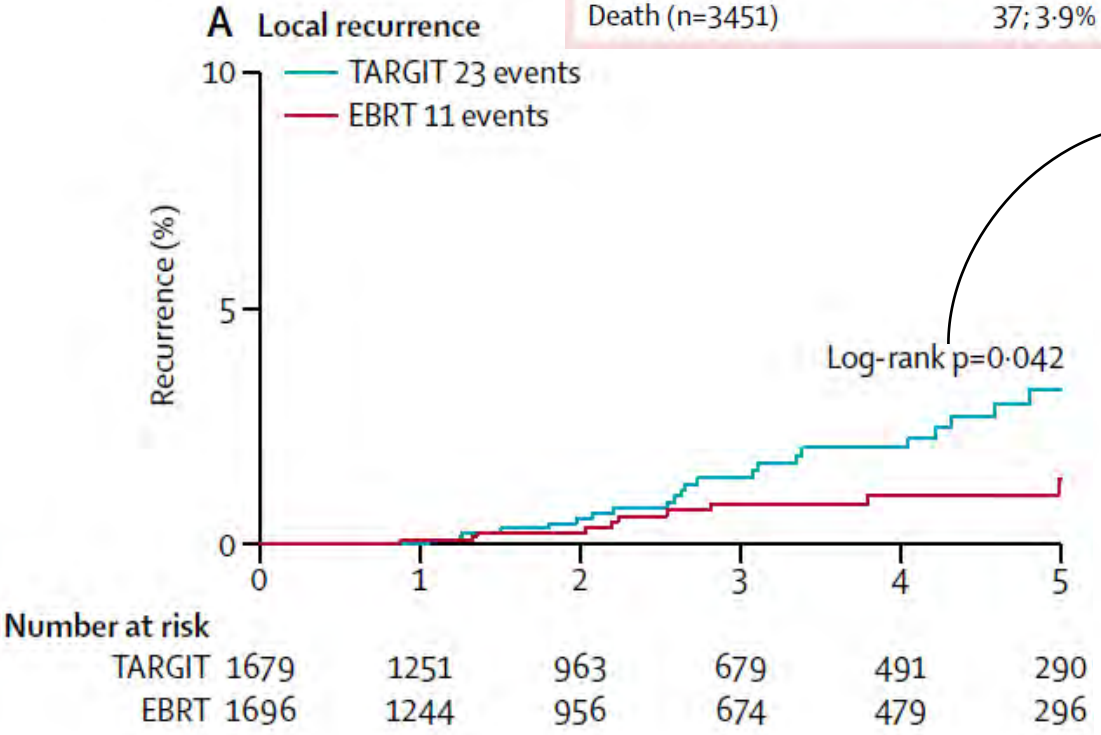
Death (n=3451)	37; 3·9% (2·7–5·8)	51; 5·3%(3·9–7·3)	–14 (–1·4%)



Authors' reply

Furthermore, we had prespecified that the significant p value for difference for the log-rank test would be less than 0·01 for local recurrence—as this was the second such analysis. So the 2% difference was not only within the non-inferiority margin but also, since the p value was 0·04, strictly speaking, it was not statistically significant.

Universitätsklinikum Mannheim

3.5 TARGIT B(oost)

A Comparison of Intra-operative Radiotherapy Boost With External Beam Radiotherapy Boost in Early Breast Cancer. (TARGIT-B)

This study is currently recruiting participants. (see Contacts and Locations)

Verified October 2015 by University College, London

ClinicalTrials.gov Identifier:
NCT01792726

Estimated Enrollment:	1796
Study Start Date:	June 2013
Estimated Study Completion Date:	April 2022
Estimated Primary Completion Date:	January 2022 (Final data collection date for primary outcome measure)

- Prospective randomized trial
- Primary outcome: local control

Inclusion Criteria:

At least one of these criteria must be satisfied:

- < 46 years of age, > 45 years of age, but with one of the following poor prognostic factors: lymphovascular invasion, gross nodal involvement (not micrometastasis), more than one tumour in the breast but still suitable for breast conserving surgery through a single specimen
- > 45 years of age, but with at least two of the following poor prognostic factors: ER and/or PgR negative, grade 3 histology, positive margins at first excision, those patients with large tumours which have responded to neo-adjuvant chemo- or hormone therapy in an attempt to shrink the tumour and are suitable for breast conserving surgery as a result, lobular carcinoma or Extensive Intraductal Component (EIC)

Exclusion Criteria:

- Bilateral breast cancer at the time of diagnosis.
- Patients with any severe concomitant disease that may limit their life expectancy
- Previous history of malignant disease does not preclude entry if the expectation of relapse-free survival at 10 years is 90% or greater (e.g., non-melanoma skin cancer, CIN, etc).

4. Meta-Analysis APBI: kV x-rays, Brachytherapy

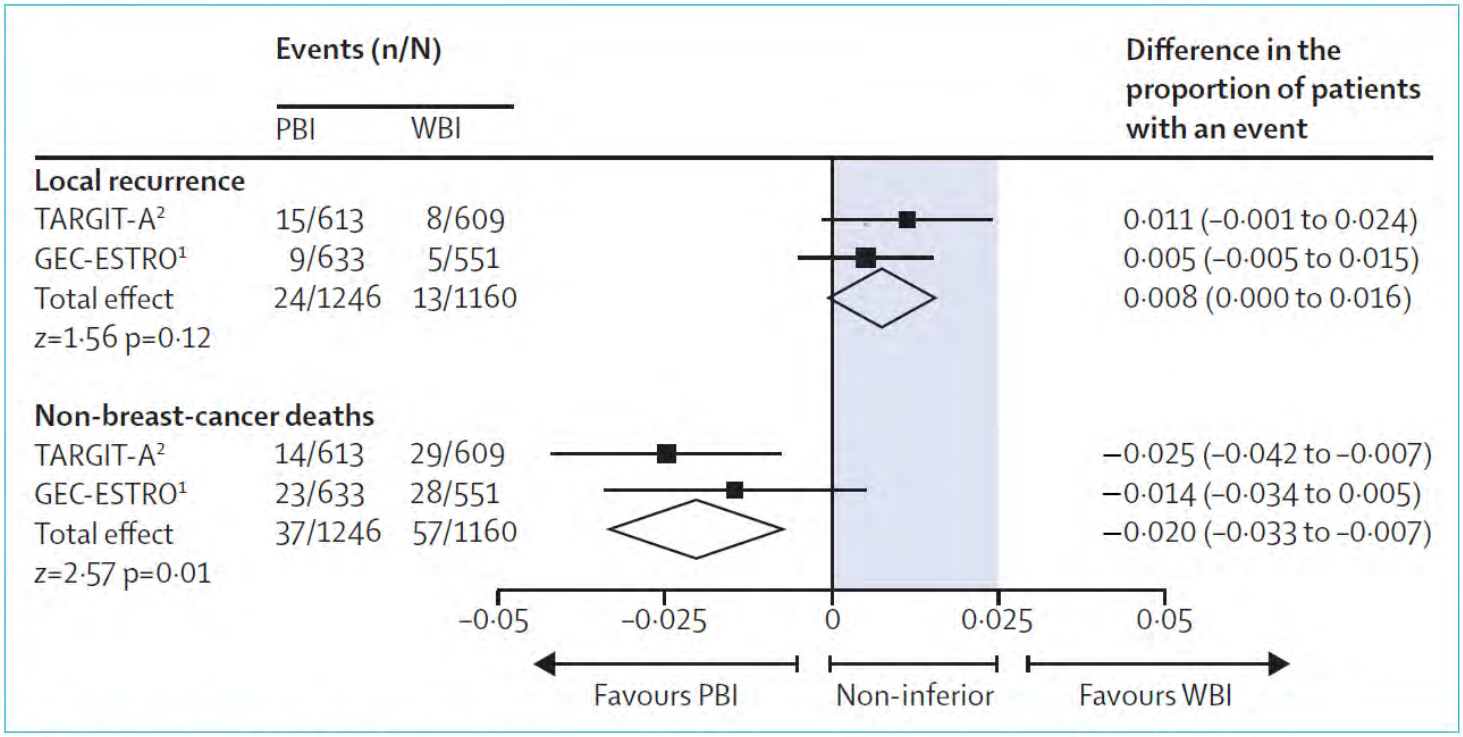

Figure 1: **Meta-analysis of the outcomes of local recurrence and non-breast-cancer mortality**
Values are numbers of patients with an event (n/N) and absolute differences in the proportion of patients who had an event in each of the randomised groups (not hazard ratios). The shaded area shows the more stringent non-inferiority margin (2·5%) for the TARGIT-A trial, rather than the margin for the GEC-ESTRO trial (3%). There was no heterogeneity between the TARGIT-A and GEC-ESTRO trial results (p=0·521 for local recurrence and p=0·515 for non-breast-cancer mortality). PBI=partial breast irradiation. WBI=whole breast irradiation.

5. Conclusion

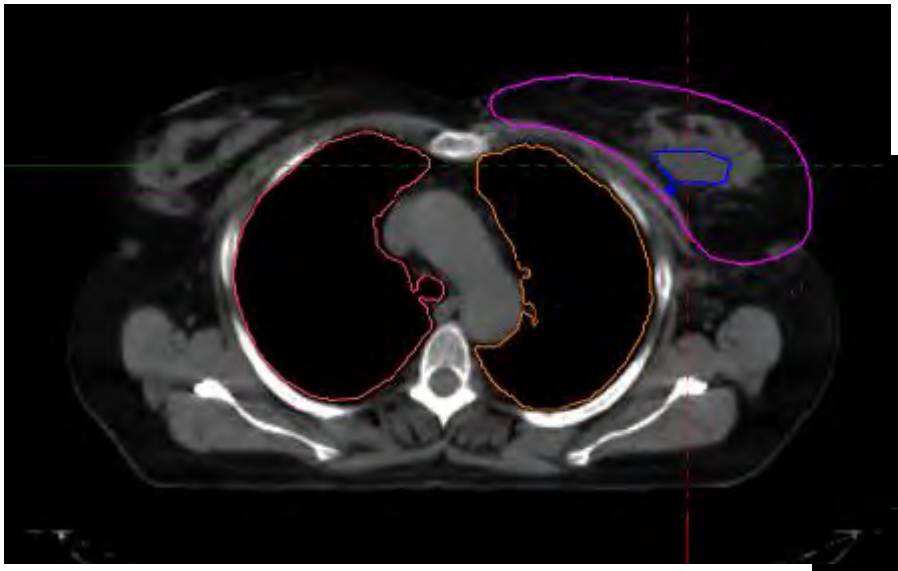
- ✓ Rising evidence for IORT in many different fields
- ✓ More and more IORT user worldwide
- ✓ Positive social and environmental benefits after IORT
- ✓ APBI, intraoperatively with electrons or kV x-rays or as brachytherapy is a safe and effective method for breast cancer
- ✓ A lot of discussion about how IORT works/radiobiology

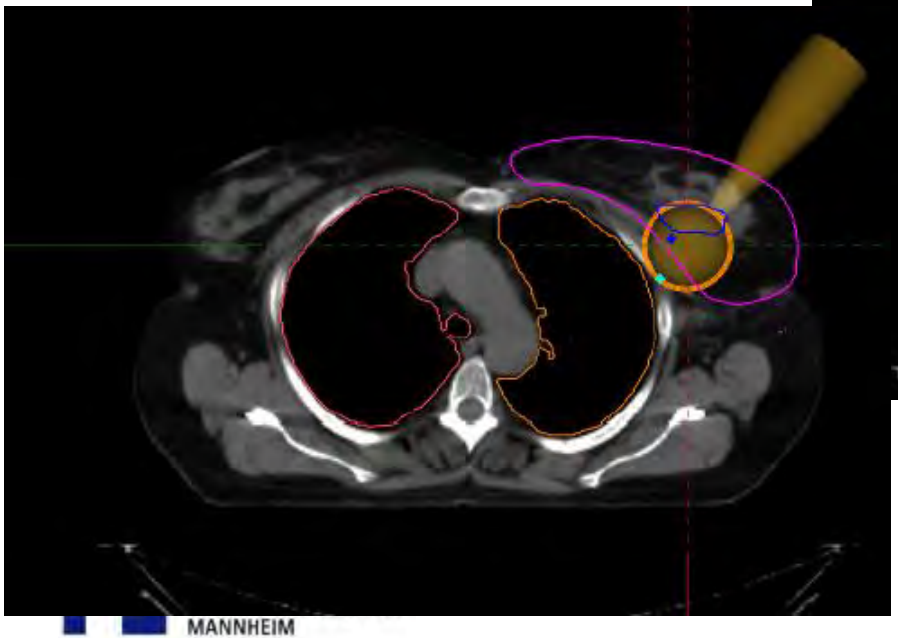
→ Update for TARGIT A whole cohort is not published, yet

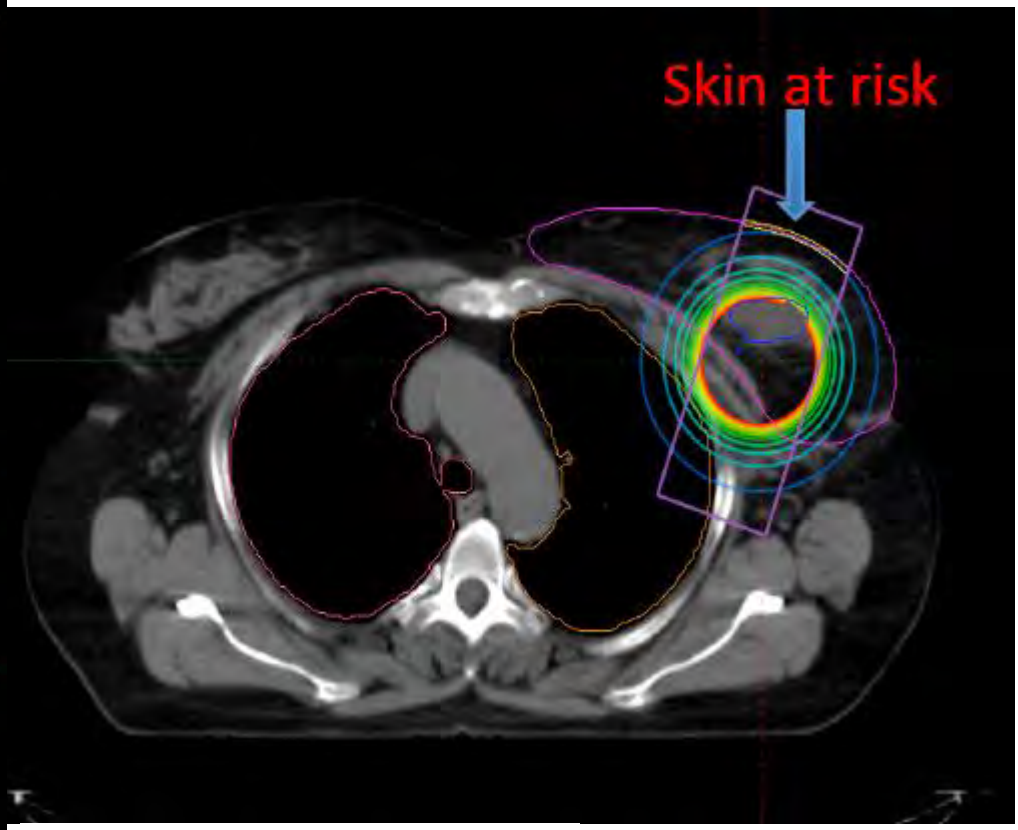
→ TARGIT A Mannheim: in preparation

→ TARGIT E: in preparation

6. What`s next: postoperative dose reconstruction







work in progress

6. What`s next: intraoperative dose reconstruction

IORT with low energy X-rays in breast cancer –

The view of a surgeon

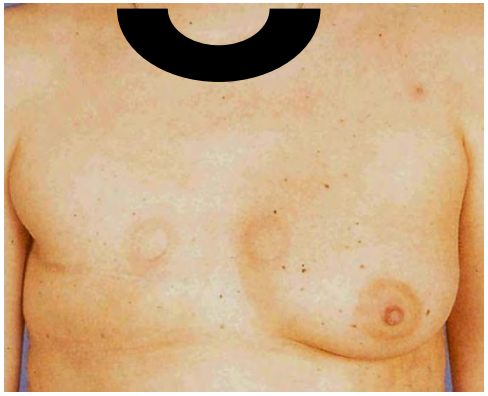
Prof. Dr. med. Marc W. Sütterlin

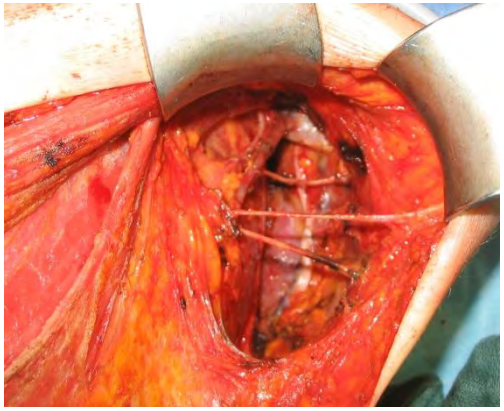
Director of the Dept. of Obstetrics, Gynecology and Reproductive Medicine, University Medical Center Mannheim

Head of the Breast and Gynecologic Cancer Center

Professor for Gynecology and Obstetrics, Medical Faculty Mannheim, Heidelberg University / Germany

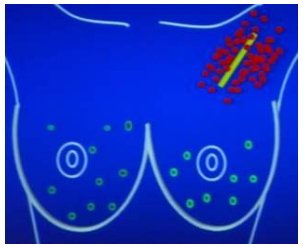
Development of risk adapted breast cancer treatment





IORT: Clinical applications

- Tumor bed boost (instead of external boost)
- APBI as a single dose TARGIT Targeted Intra-operative Radiation Therapy



- BCT after previous EBRT of the breast
  - in-breast-recurrence after BCT for BC
  - primary BC after EBRT for other reasons (e.g. lymphoma)

IORT: Pro

- reduction of postoperative radiation time

- immediate radiotherapy after tumor excision (no temporal miss)

- no geographical miss

- smaller treatment volume

- skin-sparing

IORT: Contra

- prolonged operation time

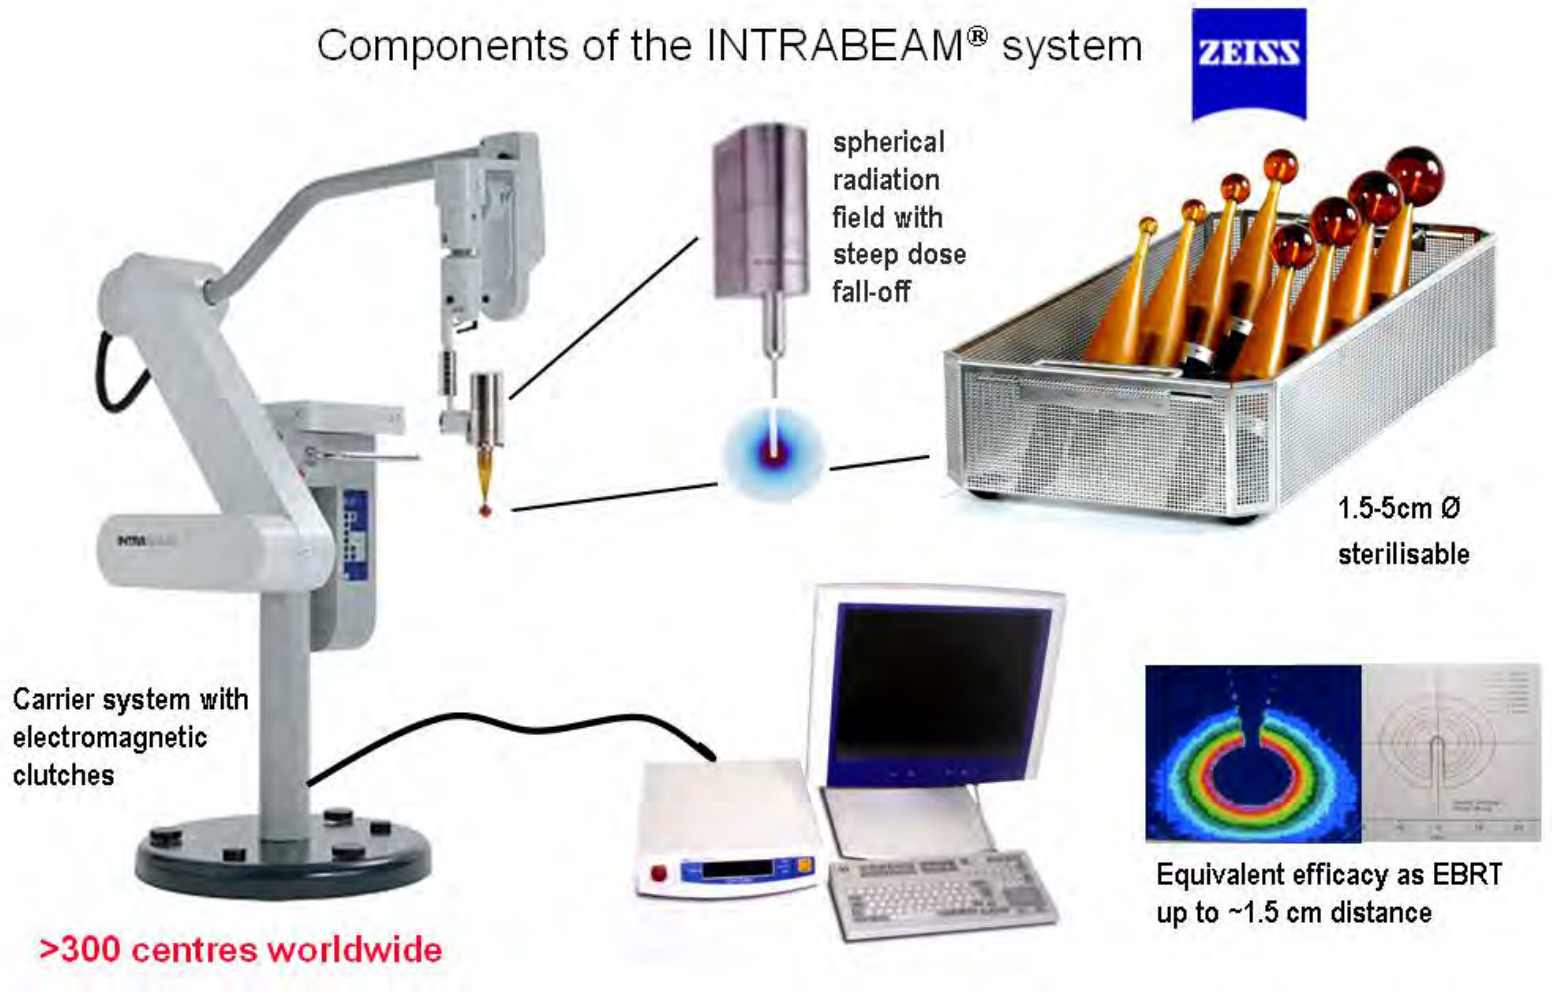
- not suitable for all BC patients (e.g. large wound cavity)

- final histological result at time of IORT not known

- limited data (in comparison to EBRT)

Intraoperative Radiotherapy (IORT) with Low Energy X-rays (max. 50 kV)

Experience in Mannheim: > 500 pts. since 2002



Irradiation time: ~20 (2.5 cm applicator)-**50 min** (5 cm applicator)

IORT with low energy X-rays: Patient selection

Clinical criteria for the use of IORT as the only radiotherapy in combination with BCS within the scope of a risk-adapted concept for early breast cancer

- ≥50 years
- positive biopsy
- unifocal tumour ≤3.5 cm
- NST (not lobular cancer)
- HR+ (positive hormone receptors)
- no EIC or L1
- cN0 cM0
- resection margin >2mm
- prepathology concept

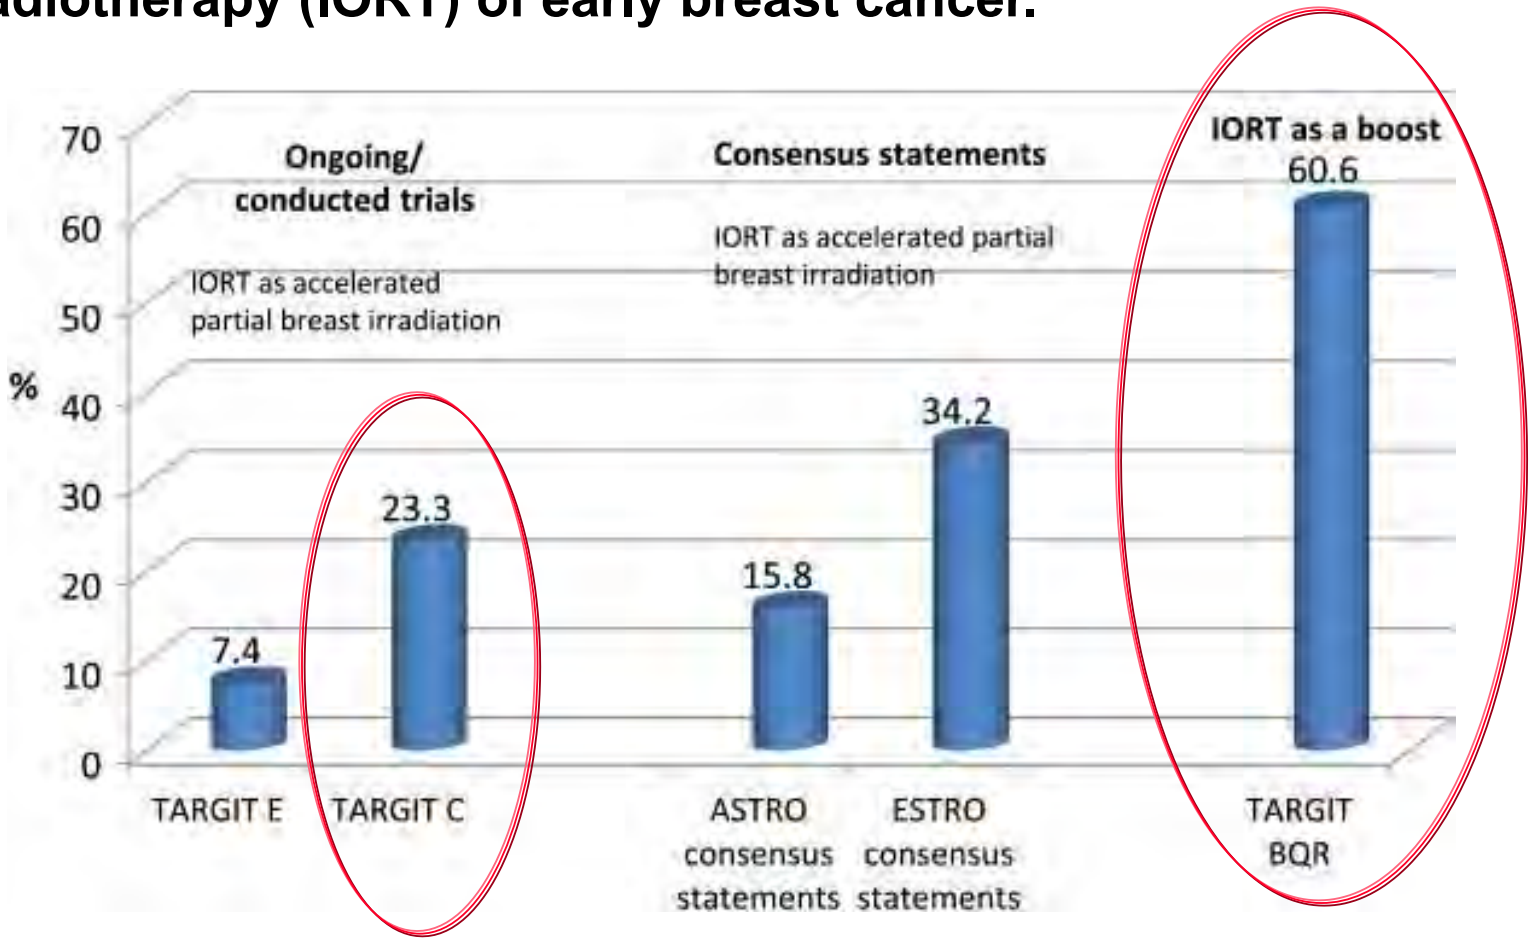
TARGIT-C(onsolidation) trial
Prospective phase IV study

If additional risk factor in final histopathology => EBRT

IORT as a boost with subsequent EBRT: whenever technically possible

UMM
UNIVERSITÄTSMEDIZIN MANNHEIM

A cohort analysis to identify eligible patients for intraoperative radiotherapy (IORT) of early breast cancer.



Eligible patients for IORT as accelerated partial breast irradiation and for IORT as a boost.
Consensus statements: ESTRO - European Society for Radiotherapy and Oncology and ASTRO - American Society for Radiation Oncology. *Trials:* TARGeted Intraoperative radioTherapy (TARGIT) E – elderly. TARGIT C – consolidation. TARGIT BQR – boost control registry. APBI – accelerated partial breast irradiation.

Targeted oncoplastic breast surgery principles	
Glandular rotation	109
Dermoglandular rotation	29
Tumor-adapted reduction mammoplasty	11

„We describe our experiences with IORT boost (50 kV energy X-rays; 20Gy) in combination with targeted oncoplastic breast surgery in a routine clinical setting. Our experiences demonstrate the **applicability and reliability of combining IORT boost with targeted oncoplastic breast surgery** in breast-conserving therapy of early breast cancer.“

International Journal of Breast Cancer 2014

Intrabeam IORT & Neoadjuvant Chemotherapy

- increasing use of neoadjuvant CT

- very limited data for combination of nCT and IORT

- so far no evidence for increased toxicity

- intraoperative pathological assessment of margins difficult

- increased risk for re-excision => loss of irradiated tissue

Initial experience of intraoperative radiotherapy as tumour bed boost after neoadjuvant chemotherapy in breast cancer patients.
Spaich S, Tuschy B, Sperk E, Wenz F, Sütterlin M;
submitted

Indications of intraoperative radiotherapy with low energy x-rays in breast cancer?

Tumor Bed Boost (followed by WBRT): **++**

APBI (single dose TARGIT): **+** (in selected pts. with risk adaption)

BCT after EBRT: **((+))** very limited data !

WBRT: whole breast radiotherapy

APBI: accelerated partial breast irradiation

BCT: breast conserving therapy

EBRT: external breast radiotherapy

Results of the TARGIT A-trial in context

5-year-Local Recurrence-rates:

TARGIT A Prepathology Stratum (2,298 pts): IORT 2.1% vs. EBRT 1.1%

NSABP B32 (5,611 pts): SNB 0.7% vs. SNB+ALND 0.4%*

ACOSOG Z0011 (n=891): Ø ALND 1.3% vs. ALND 0.7%* (after pos. SNB)

AMAROS (n=1,425): ax. Rad. 1.03% vs. ALND 0.54%* (after pos. SNB)

* ax. recurrence

Intrabeam Applicator Selection & Fibrosis

Elena Sperk, Xuerui Li, Frank Schneider, Sven Clausen, Christel Weiß, Frederik Wenz

Background:
- Fibrosis is the most frequent adverse event after IORT Boost in combination with EBRT
- Interval >5 weeks between IORT and EBRT reduces risk of higher grade fibrosis

=> Evaluation of dosimetric risk factors for fibrosis using a simulated irradiation plan

IORT cases between **2002 – 2008, Follow up ≥ 3 Jahre**

Collectives

•Group A: Cases with fibrosis ° II-III, n=14

•Group B: Cases without fibrosis , n=28

- Significantly increased rate of fibrosis ° II-III due to larger applicatiors and 50% dose volume
- Multivariate analysis: Applicator size is an independent risk factor for fibrosis ° II-III

→ **For each cm of applicator diameter the risks of fibrosis increases by factor 3.85**

The applicator size is an independent risk factor for the development of clinically relevant fibrosis after IORT boost

Omission of planned Intrabeam-IORT

UMM: 2002 until 2/2009

57 cases (19%) with omission of planned IORT (∑ 299)
(7 Targit cases)

Most frequent reasons (80% of all reasons)

- Insufficient distance from tumor to skin
- Large wound cavity
- Tumor size

IORT for patients where EBRT is not an option

IORT in breast cancer (relapse) after EBRT

Evidence-Based Medicine

The Evidence Pyramid is a guideline to the hierarchy of study design

Level	Intervention	Diagnostic accuracy	Prognosis	Aetiology	Screening Intervention
I [4]	A systematic review of level II studies	A systematic review of level II studies	A systematic review of level II studies	A systematic review of level II studies	A systematic review of level II studies
II	A randomised controlled trial	A study of test accuracy with: an independent, blinded comparison with a valid reference standard,[5] among consecutive persons with a defined clinical presentation[6]	A prospective cohort study	A prospective cohort study	A randomised controlled trial
III-1	A pseudorandomised controlled trial (i.e. alternate allocation or some other method)	A study of test accuracy with: an independent, blinded comparison with a valid reference standard,[5] among non-consecutive persons with a defined clinical presentation[6]	All or none	All or none	A pseudorandomised controlled trial (i.e. alternate allocation or some other method)
III-2	A comparative study with concurrent controls: ▪ Non-randomised, experimental trial[9] ▪ Cohort study ▪ Case-control study ▪ Interrupted time series with a control group	A comparison with reference standard that does not meet the criteria required for Level II and III-1 evidence	Analysis of prognostic factors amongst persons in a single arm of a randomised controlled trial	A retrospective cohort study	A comparative study with concurrent controls: ▪ Non-randomised, experimental trial ▪ Cohort study ▪ Case-control study
III-3	A comparative study without concurrent controls: ▪ Historical control study ▪ Two or more single arm study[10] ▪ Interrupted time series without a parallel control group	Diagnostic case-control study[6]	A retrospective cohort study	A case-control study	A comparative study without concurrent controls: ▪ Historical control study ▪ Two or more single arm study
IV	Case series with either post-test or pre-test/post-test outcomes	Study of diagnostic yield (no reference standard)	Case series, or cohort study of persons at different stages of disease	A cross-sectional study or case series	Case series

Assessment of study quality
Grades of Recommendations

1. The evidence base, in terms of the number of studies, **level of evidence** and quality of studies (risk of bias).
2. The consistency of the study results.
3. The potential clinical impact of the proposed recommendation.
4. The generalisability of the body of evidence to the target population for the guideline.
5. The applicability of the body of evidence to the healthcare context.

Grade of recommendation	Description
A	Body of evidence can be trusted to guide practice
B	Body of evidence can be trusted to guide practice in most situations
C	Body of evidence provides some support for recommendation(s) but care should be taken in its application
D	Body of evidence is weak and recommendation must be applied with caution

What is the purpose of EBM in IORT?

- Patient care
- Public health
- Research

➢ *Improving the quality of patients' lives…*

Evidence Based Medicine and IORT: BREAST CANCER

Clinical question

- Population — Breast cancer pts
- Intervention — IORT
- Comparator — EBRT
- Outcome/s — **

The PICO method

**

- Is the rate of local cancer recurrence, disease-free survival rates and/or overall survival rates the same or lower for IORT treated patients compared to those treated by standard breast conservation therapy? LR
- Are there the same number or fewer perioperative complications, short-term and long-term postoperative complications associated with the IORT patients compared to those treated by standard breast conservation therapy? TOX
- Is cosmesis (both surgeon and patient-rated cosmesis) the same or better with the IORT patients compared to those treated by standard breast conservation thera COSMESIS

Conclusion

The evidence currently available on the use of IORT in early breast cancer is poor. Therefore, both the relative safety and efficacy of the IORT in comparison with BCT cannot be determined. In view of this, the ASERNIP-S review group has recommended that IORT in early breast cancer should only be used in Australasia under the auspices of a randomised controlled trial. Further national and international research should focus on several issues that also require more clarification. The subgroups of early breast cancer patients most suited to IORT should be clearly identified and the differing roles that IORT may play in both "high" and "low" risk tumours needs further exploration.

EBM and IORT: Materials and Methods

In 2005 a structured questionnaire was mailed to all the Italian Radiation Oncology centres known to perform (or being in the process of implementing) IORT and it was updated at the end of 2007. Indication of treatment modality, use of dedicated or multi-purpose facilities, treatment sites, participation in clinical studies, as well as adherence to EBM as defined in the national guidelines were acquired

EBM and IORT

The analysis of the data received provided the consent of the Centers on 4 sites of disease in which IORT was considered an evidence-based treatment:

- locally advanced rectal cancer
- recurrence of rectal cancer
- soft tissue sarcomas
- pancreatic neoplasms

NO BREAST CANCERS !!!

Special commentary

Has partial breast irradiation by IORT or brachytherapy been prematurely introduced into the clinic?

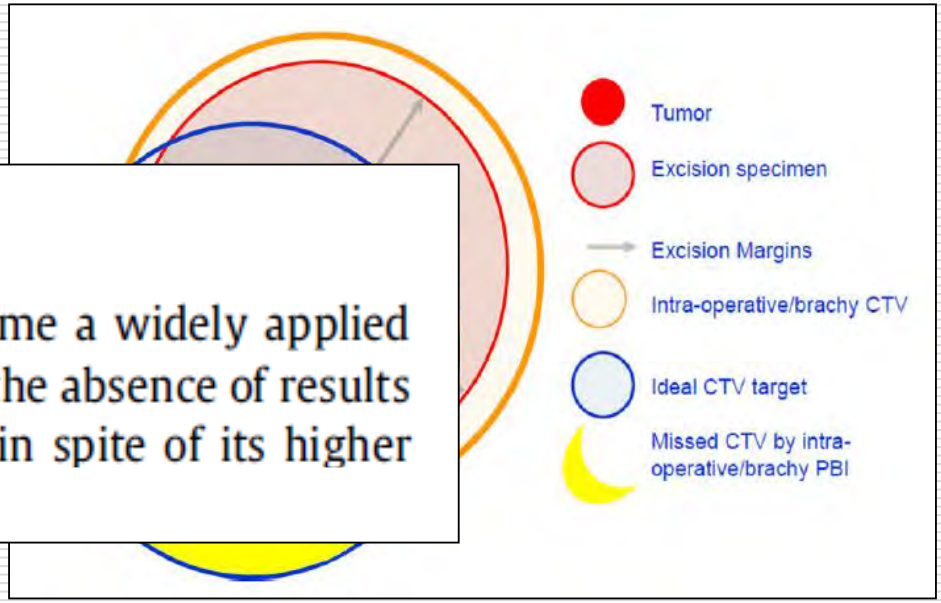
Harry Bartelink [a,*], Celine Bourgier [b], Paula Elkhuizen [a]

[a] Netherlands Cancer Institute, The Netherlands; [b] Institut Gustave Roussy, France

Evidence based medicine – local control after APBI?

- ✓ No publication of large randomized clinical trials with sufficient follow up is available
- ✓ Some syudies have imited numbers of patients per treatment arm and are underpowered
- ✓ One of the main limitations of brachy PBI or IORT is the absence of pathology information during the procedures

Evidence based medicine – APBI target volumes?



Conclusions

PBI with brachytherapy or IORT has become a widely applied treatment also outside clinical trials, even in the absence of results from the ongoing major phase III trials and in spite of its higher cost.

The "Guidelines"…

Strahlentherapie und Onkologie 10 · 2013

Intraoperative Radiotherapy: Summary

The German guidelines still do not recommend APBI outside clinical studies. Radiotherapy restricted to parts of the affected breast (PBI) as sole radiation treatment including sole intraoperative radiotherapy (IORT) represents no treatment standard.

The "Guidelines"...

2013

I primi risultati degli studi prospettici (36,37) mostrano che il trattamento con IORT in dose unica, in pazienti selezionate a basso rischio di recidiva locale, è sicuro e ben tollerato, anche se il follow-up è ancora breve. Sebbene tali risultati sembrino promettenti, essi confermano l'opportunità di procedere al trattamento con IORT solo dopo appropriata e corretta selezione delle pazienti che tenga conto di tutti i criteri di rischio ASTRO ed ESTRO (14,15), di cui è possibile disporre prima dell'intervento chirurgico.

Indicazioni

IORT esclusiva, anche al di fuori di studi clinici.

La Radioterapia intraoperatoria (IORT) è una modalita' di **irradiazione parziale** e si ritiene indicata come **trattamento esclusivo** in un sottogruppo di Pazienti operate conservativamente e considerate **a basso rischio di recidiva locale**.

IORT con elettroni con finalità di Boost anticipato.

Le **indicazioni**, al di fuori di studi clinici, sono le **stesse della IORT esclusiva** per quanto riguarda le caratteristiche di T (dimensioni, unifocalità, ecc.) mentre le Pazienti possono avere **un'età ≤ 50 anni e stato premenopausale.**

Conclusion and Future Directions

STRONG LEVEL OF EVIDENCE

APBI has been [illegible] investigation for more than 15 years. The [illegible] the underlying biology, optimal technical [illegible] ent selection criteria, and imaging changes [illegible] up has increased enormously. After the completion [illegible] phase III trials with long-term follow-up [39], APBI is [illegible] currently increasingly used either in phase IV studies, in registries, stud[illegible] 41]. One may expect that 15–25% of the patients undergoing BCS may qualify for APBI alone, and up to 60% for APBI as a boost followed by WBRT [9].

MeSH terms and free terms ... electronic search. There were no restrictions ... The references of the included studies were also reviewed to identify potentially eligible article... Z.Z.) conducted the literature sear...

Total 2189 records identified through electronic search

2 additional records identified through other sources

Study Characteristics

The 4 included studies, consisting of 2 RCTs[12,13,25] (the ELIOT and TARGIT trials) and 2 non-RCTs,[23,24] included 5415 patients: 2702 patients in the IORT arm and 2713 in the EBRT arm. The baseline characteristics of each study were balanced

Quality Assessment

Overall, the methodological quality of the 2 RCTs was good. Both the 2 RCTs had a score of 8 points. Points were lost because the patients and investigators were not blinded. The MINORS' scores of the other 2 non-RCTs were both 20 and were acceptable.

TABLE 1. The Main Characteristics and the Quality Assessment Results of the Included Studies

Author Year	Dates of Accrual	Study Design	Patient Characteristics	Sample Size	Arms			Outcome	Quality assessment: PEDro scale	Quality assessment: MINORS
Veronesi et al 2013 (ELIOT)	2000–2007	RCT	48–75 years old;	1305	IORT (N = 65		5.8 years	Ipsilateral breast	8	/

Accepted Manuscript

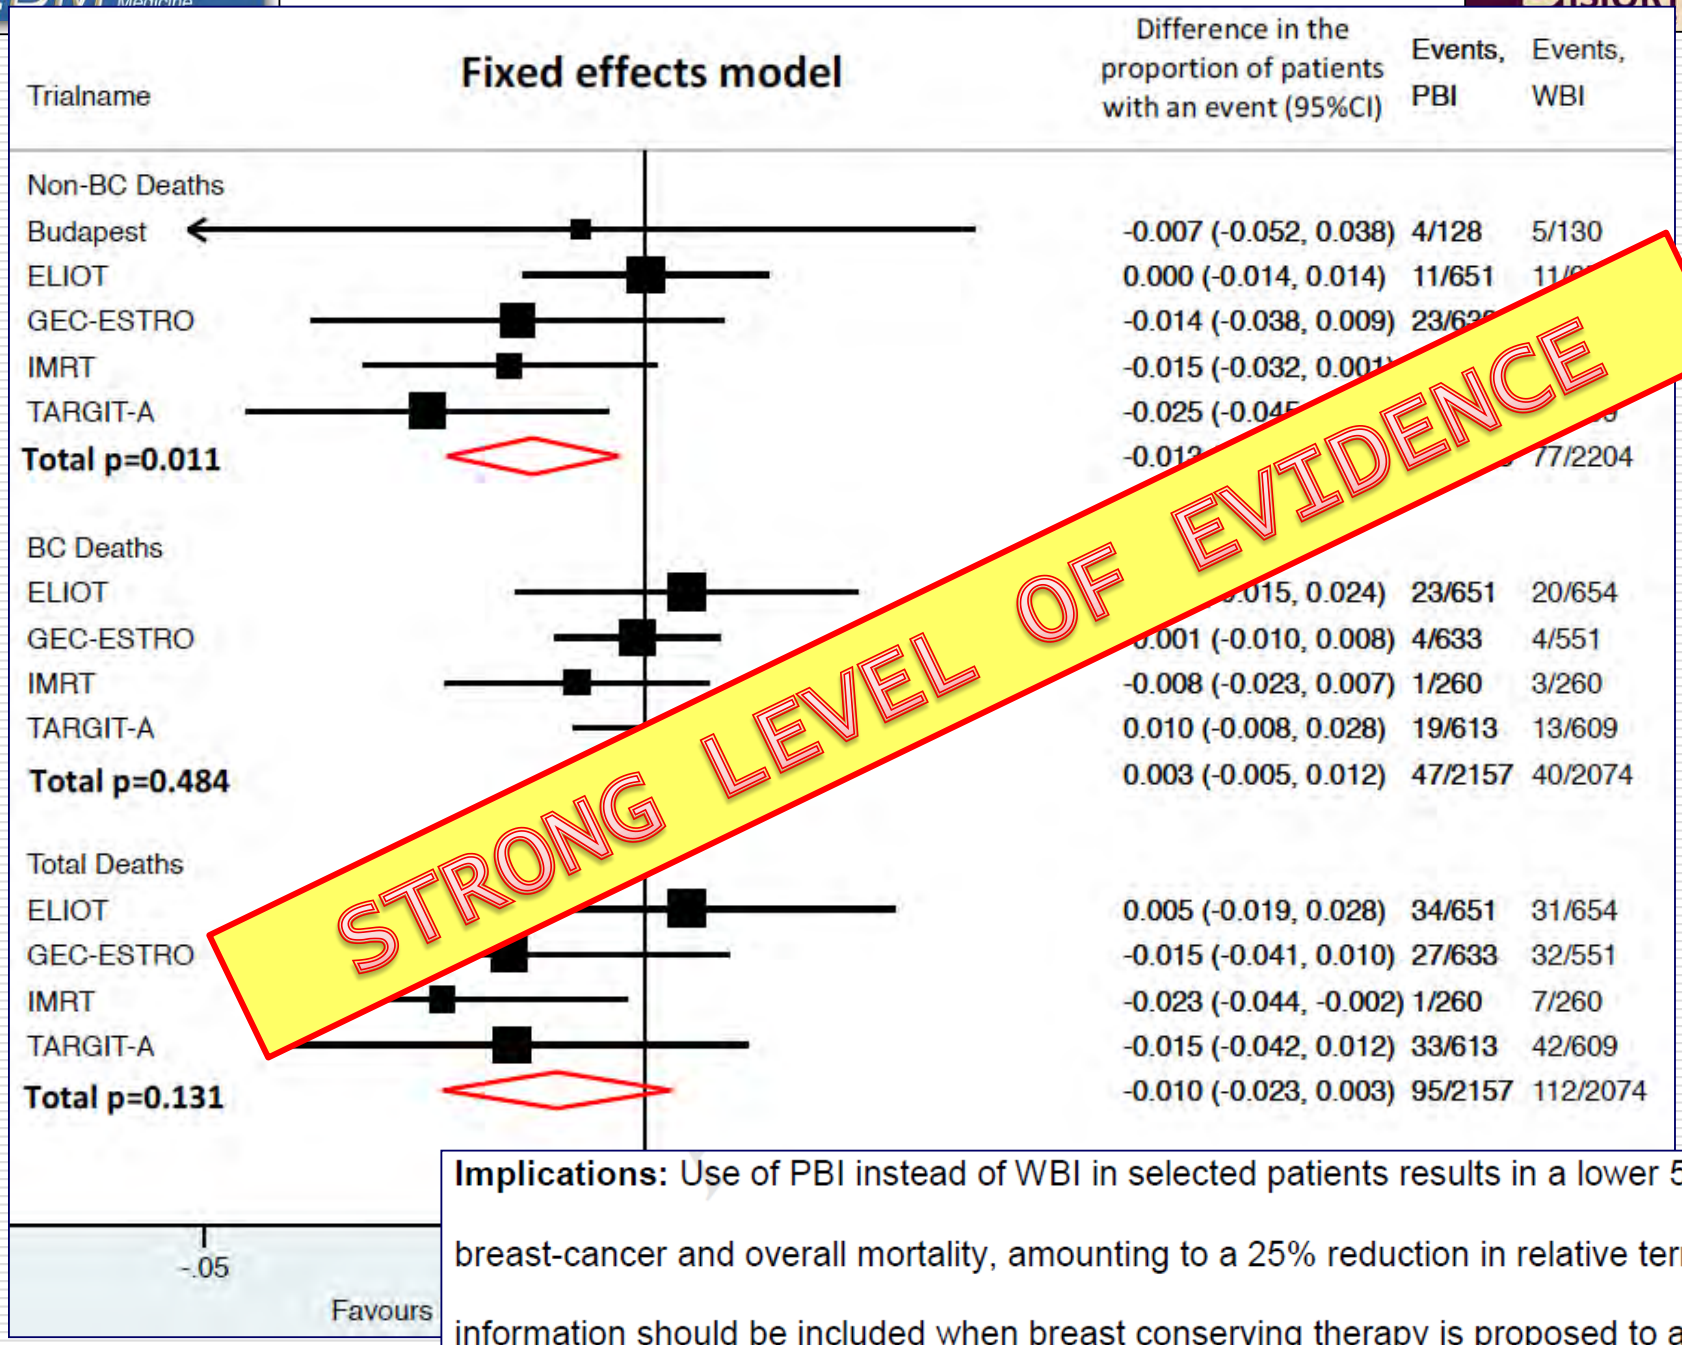
Reduced mortality with partial breast irradiation for early breast cancer – a meta-analysis of randomised trials

Professor Jayant S. Vaidya, Professor of Surgery and Oncology, Professor Max Bulsara, Professor of Biostatistics, Professor Frederik Wenz, Professor of Radiation Oncology, Mr Nathan Coombs, Consultant Surgeon, Dr Julian Singer, Consultant Clinical Oncologist, Mr Stephen Ebbs, Consultant Surgeon, Dr Samuele Massarut, Head of Breast Services, Professor Christobel Saunders, Professor of Surgery, Professor Michael Douek, Professor of Surgical Oncology, Dr Norman Williams, Reader, Professor David Joseph, Professor of Radiation Oncology, Professor Jeffrey S. Tobias, Professor of Cancer Medicine, Professor Michael Baum, Emeritus Professor of Surgery

DOI: 10.1016/j.ijrobp.2016.05.008

A meta-analysis of 5-year data from 9 published randomized trials of PBI vs WBI, found no difference in breast cancer mortality (n=4489,difference 0.000%(95%CI -0.7 to +0.7),p=0.972).

PBI was better than WBI for non-breast cancer mortality (n=4231,difference 1.1% (95%CI -2.1% to -0.2%),p=0.023),and total mortality (difference 1.3% (95%CI -2.5% – 0.0%),p=0.05), leading to a 25% relative risk reduction.



STRONG LEVEL OF EVIDENCE

Implications: Use of PBI instead of WBI in selected patients results in a lower 5-year non-breast-cancer and overall mortality, amounting to a 25% reduction in relative terms. This information should be included when breast conserving therapy is proposed to a patient.

Supported by level-one evidence

ELIOT and TARGIT are supported by strong evidence if patients are valuated according to ESTRO and ASTRO criteria

Risk-adaptive technique

It should be pointed out that IORT cannot always be given, even in women who meet the eligibility criteria.

…for insufficient tumor-skin distance, oversized wound cavity or a combination of both

Reduced irradiation of normal tissues

In addition to the avoidance of irradiation of skin, the rapid attenuation of IORT X-rays means there is much less radiation exposure to normal tissues.

The estimated risk for secondary cancer was considerably lower after IORT and/or APBI as compared to EBRT (23).

Better cosmetic outcome

Objective and Subjective valuation

Economically viable

The institutional perspective

Much cheaper than LINAC
No shieldings
Alternative method of delivering dose
Depending on the level of remboursement
Saved time in Radiotherapy Dept.
Procedure in the meantime of surgery

Societal perspective

Total treatment time
Travel time
Time off work (patient and family).

Excellent patient preference and satisfaction

The majority of women with breast cancer will accept a small increment of local risk for a simpler delivery of radiation.

Better quality of life

A review of 227 studies for aesthetic in breast surgery found only one that was validated

Pusic AL, Plast Reconstr Surg 2007

IORT patients (TARGIT) presented less general pain,fewer breast and arm symptoms, and better role functioning than EBRT patients (P<0.01)

Therefore in the clinical cases of lower risk of recurrence and respecting the strict selection criteria, IORT should be taken into account, considering also the advantage of a good quality of life and the less chronic skin toxicities especially after IORT alone identified in IORT patients (20).

The complexity in surgical techniques and oncologic treatment involves a multidisciplinary team and require a continuous dynamic communication between oncologic surgeon, plastic surgeon and radiotherapist to carry out a successful breast cancer treatment that satisfy the patient and ensure an adequate local control of the tumor.

Rectum	156	567	723
Anus	13	33	46
Total	418	865	1283

IORT Rationale

Tumor control probability
Radiobiologic Axioms

- Surviving fraction of tumor cells is a function of radiation dose
- Functional radiation effects in normal tissues is related to dose
- The dose needed to obtain tumor control may exceed normal tissue tolerance

Radiation Tolerance Doses

Organ	Injury at 5 yrs	1-5% $TD_{5/5}$	25-50% $TD_{5/5}$	Volume or length
Esophagus	Ulcer, stricture	60-65 Gy	75 Gy	75 cm^3
Stomach	Ulcer,perforation	45-50 Gy	55 Gy	100 cm^3
Intestine	Ulcer, stricture	45-50 Gy	55 Gy	100 cm^3
Colon	Ulcer, stricture	55-60 Gy	75 Gy	100 cm^3
Rectum	Ulcer, stricture	55-60 Gy	75 Gy	100 cm^3
Anus	Ulcer, stricture	60-65 Gy	75 Gy	Whole
Liver	Liver failure	35 Gy	75 Gy	Whole
Bile Ducts	Stricture	50 Gy	70 Gy	--

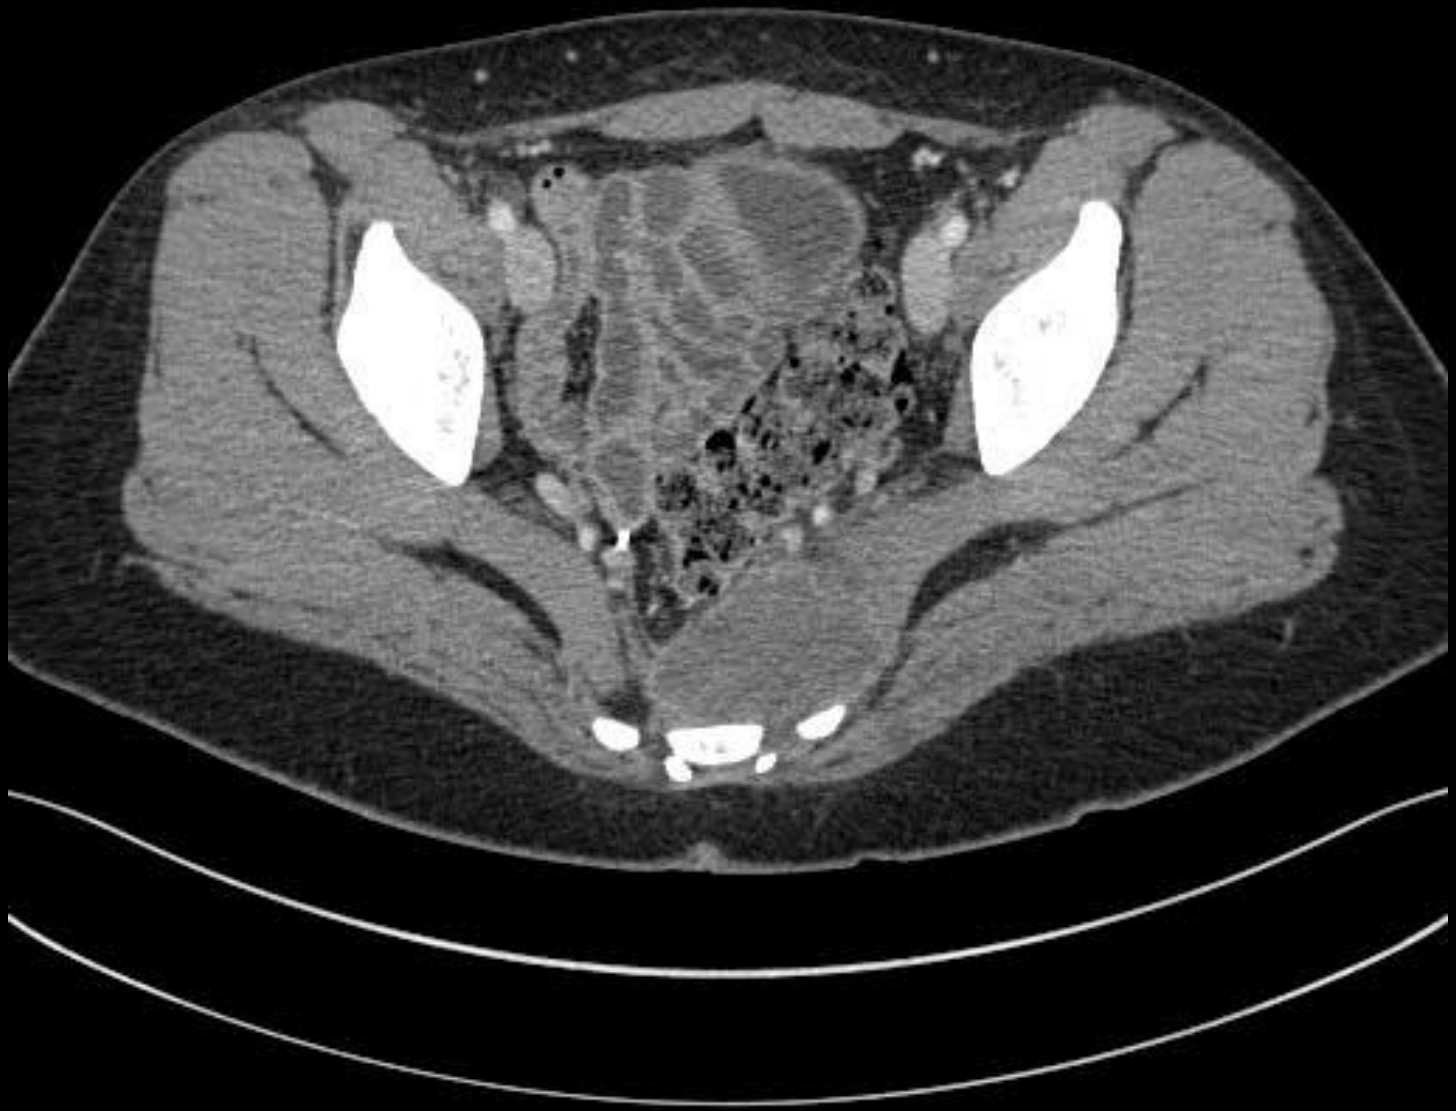
Gunderson and Martenson, Front Radiat Ther Oncol 23:277, 1988

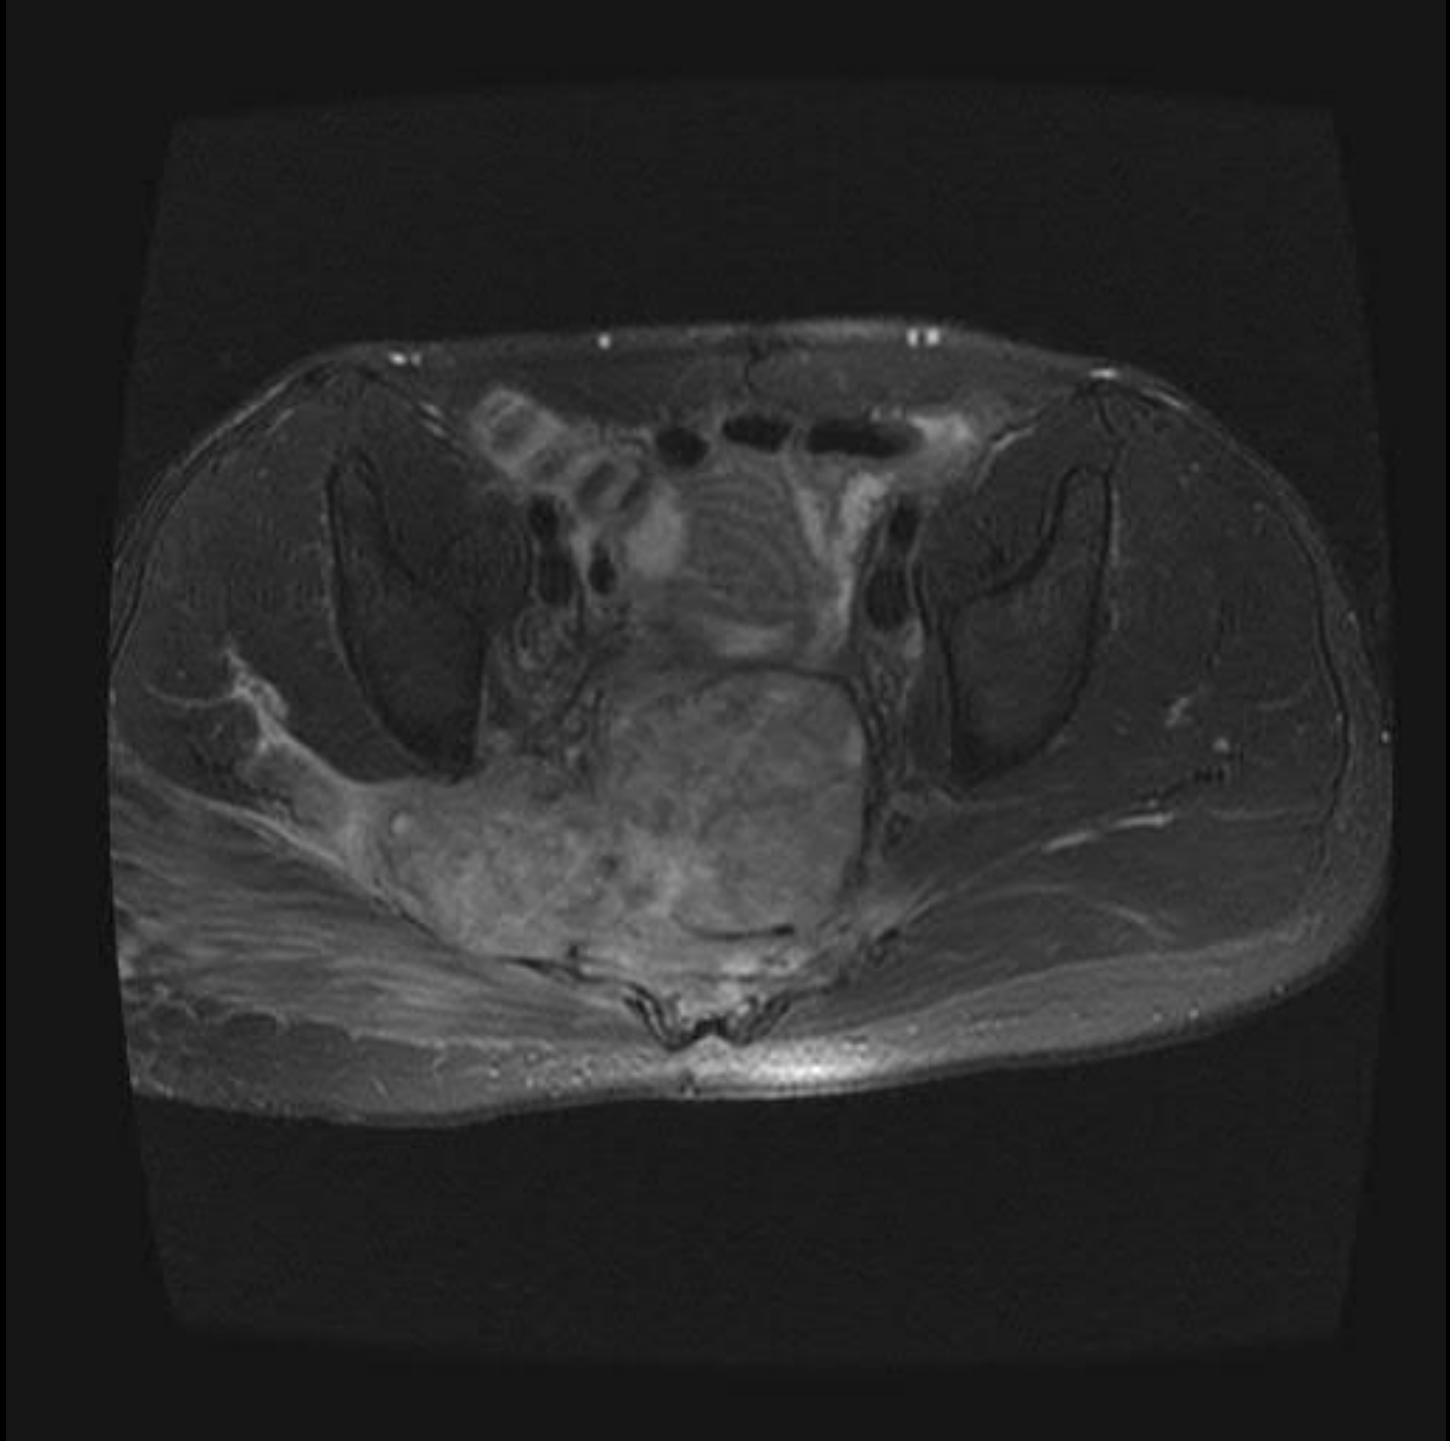
IORT
General Rationale

- able to treat small volume of tissue within IORT boost field
- can limit dose to sensitive normal organs such as small bowel
- can increase effective radiation dose – IORT is dose escalation tool

Patient Selection Criteria
IOERT

- Surgery alone unacceptable local control
- External beam dose > 60 - 70 Gy for curative attempt
- IOERT at time of planned operative procedure
- IOERT + EBRT would theoretically result in a more favorable therapeutic ratio between cure and complications
- No evidence of distant disease or distant disease treatable for cure





IORT for GI Malignancies
Potential IORT Sites

- Esophageal Cancer
- Gastric Cancer
- Biliary Cancer
- Pancreas Cancer
- Colorectal Cancer
- Anal Cancer

Esophageal Cancer
IORT

- Lower esophageal cancer > 6 cm
  - 45 pts IORT
  - 30 pts no IORT
- 20-30 Gy IORT to upper abd nodes
- 68% received EBRT
- 60% received chemotherapy

Tamaki, J Rad Research 53:882-891, 2012

Esophageal Cancer
IORT

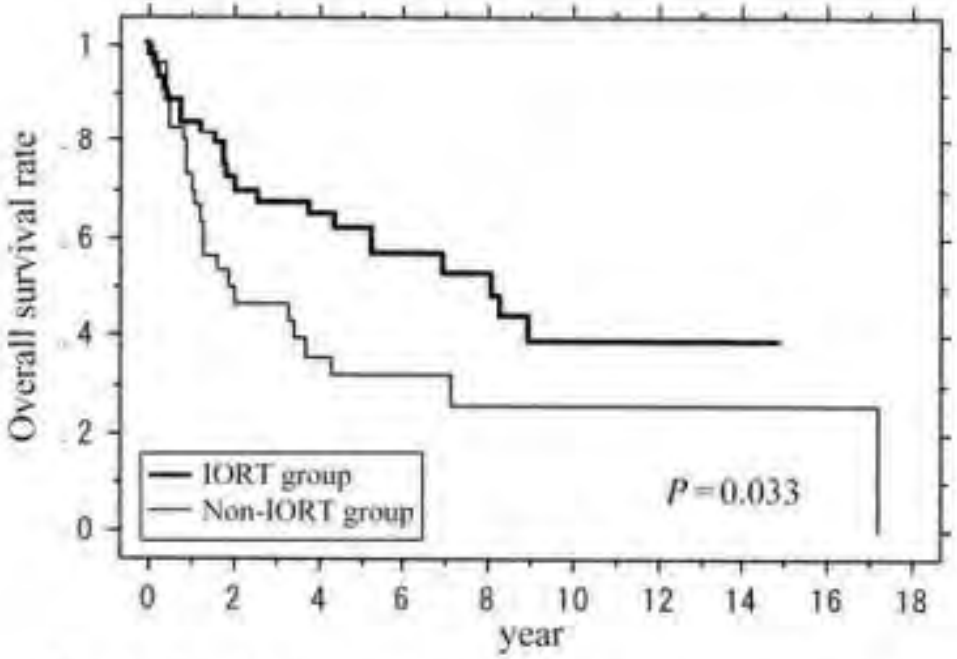


Fig. 3. Kaplan-Meier analysis of overall survival rate in the IORT group ($n = 45$) and non-IORT group ($n = 30$) within the subgroup of patients whose primary lesion was located in the lower thoracic or abdominal part of the esophagus or measured >6 cm in length.

Abdominal control
89% vs 63%
P = 0.01

Tamaki, J Rad Research 53:882-891, 2012

IORT for GI Malignancies
Conclusions

- IORT is an important component of an intensive multidisciplinary effort
- IORT associated with improved local control and survival in locally advanced primary and recurrent disease
  - Esophagogastric cancer
  - Biliary cancer
  - Pancreatic cancer
  - Colorectal cancer
- Gross total resection is key prognostic factor

IORT for GI Malignancies
Conclusions

- Distant relapse is main pattern of failure for most GI sites
- Nerve is dose limiting for IOERT
  - Higher frequency and severity with IOERT dose > 1250 cGy
- Multimodality curative intent approach is appropriate for selected patients

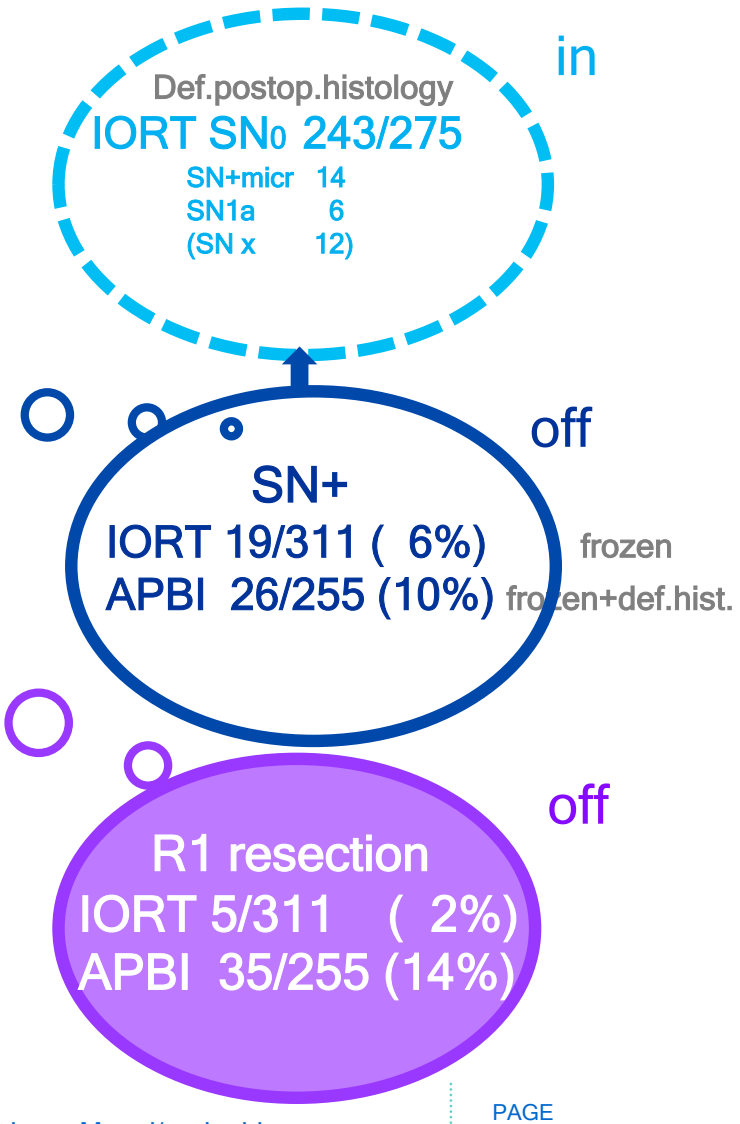
Off study	41	78
On study	251	170



* bone M and/or double tumor
** primary tumour too large

Possible risk factors that might explain difference?

"new phenomenon" !!??

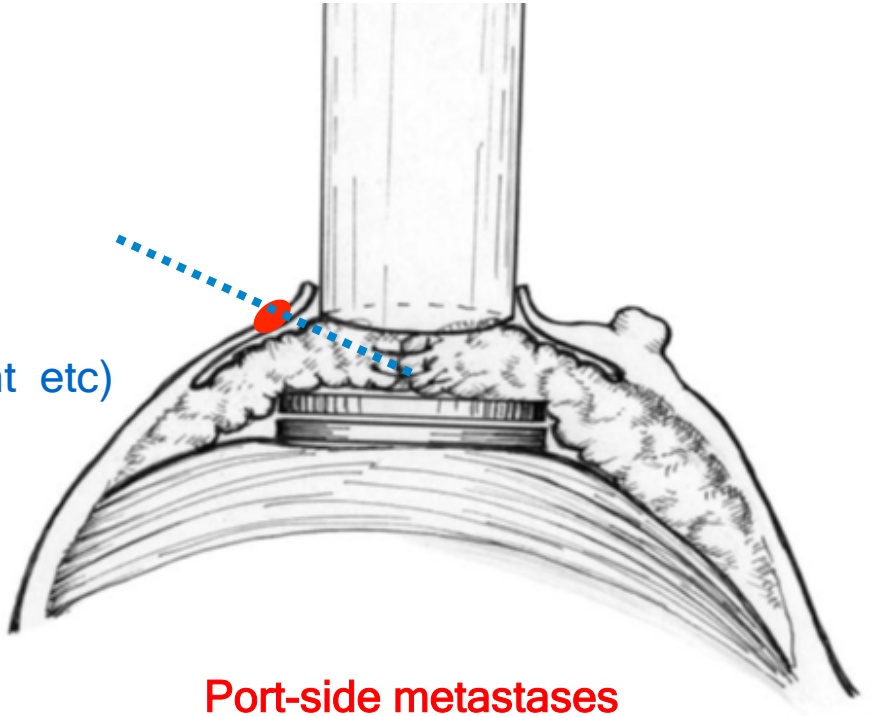
25% of (TLR) IBTR

port-side metastases

=biopsy tract spill (histological identical ; first event etc)

15% uncertain

1. in combination with distant M
2. still unclear (histology) but "looks like"



Port-side metastases

IBTR / metastases in reconstructed path of (mammography/sterotactic) biopsy

HOW ?

Your radiologist is trying to help you !?!

Review article; "Therapeutic potential of Breast Lesion Excision System:is it feasible to completely excise small solid carcinomas?"

Not completely New. Has been reported in skin sparing mastectomy

WHEN?

Grade 3 !! Although not exclusively

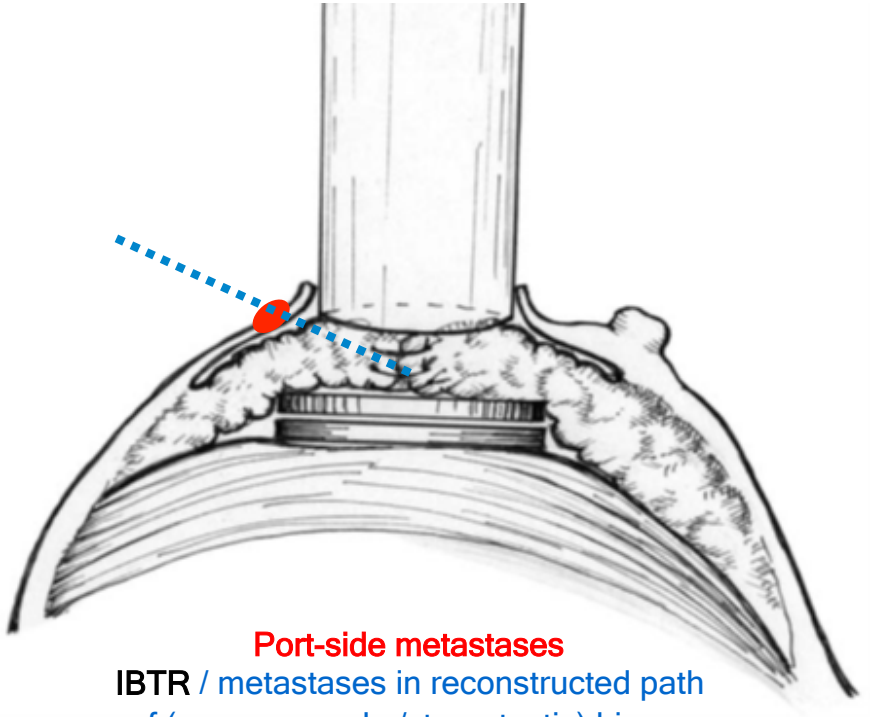
T2 gr 3, 25 mm, margin 3 mm, ER+PR-HER-; tamoxifen
T1c gr 3,17 mm + DCIS gr 3, margin 1mm, ER-PR-HER+++; no adj syst.
T1c gr 2, 12 mm + DCIS gr 2, margin 3 mm, ER+PR-HER-; no adj syst.

Grade 3 > 4% ; Grade 2 = 0.5%

Adjustment of surgical protocol:

Colour picture and ink marking (patient) of biopsy site

Surgical removal of biopsy site at lumpectomy / SN



Port-side metastases
IBTR / metastases in reconstructed path of (mammography/stereotactic) biopsy

TLR?
Out Q recurrence?

Factors that contribute to early tumor failure after APBI/IOERT for elderly breast cancer patients

Conclusions part 1 / take home message

There is more than IORT for a “successful IORT treatment”!

Port side recurrence / biopsy tract spill

Biopsy procedure (be aware of efforts to completely excise small tumours)
Unsuspected biopsy direction

Addendum surgical protocol: mark biopsy and remove

Surgical protocol (we expected more R1 for IORT, but found less!)
Immediate pathology check / specimen mammography is important

Factors that contribute to early tumor failure after APBI/IOERT for elderly breast cancer patients

RCWEST
RADIOTHERAPIECENTRUM WEST

Conclusions part 2

Lessons learned from IORT vs APBI comparison

Surgical protocol (we expected more R1 for IORT, but found less!)
Immediate pathology check / specimen mammography is important

APBI can (more easily) select favourable patients (exclude unfavourable ?)
Treatment bias?

DCIS favourable? DCIS registration study
grade 3 unfavourable for TLR / port side metastases ? IBTR ?

These are early results …..Longer follow up needed !!!

Act. 2 year IORT TLR 0.5 / 1.2% (IBTR all 1.9%); APBI TLR 0% / 0% (IBTR all 0%)

Thanks for your attention

Peter

BREAST CONSERVING SURGERY:

INTRAOPERATIVE RADIOTHERAPY USING NOVAC 7, EXPERIENCE WITH 703 CASES AT CITTÀ DI CASTELLO HOSPITAL (ITALY).

USL Umbria 1

Marina Alessandro

Radiation Oncology Department

Città di Castello Hospital

RATIONALE

In the last years there has been growing interest to experience less extensive treatments for selected patients at low risk of locoregional and systemic recurrence of breast cancer

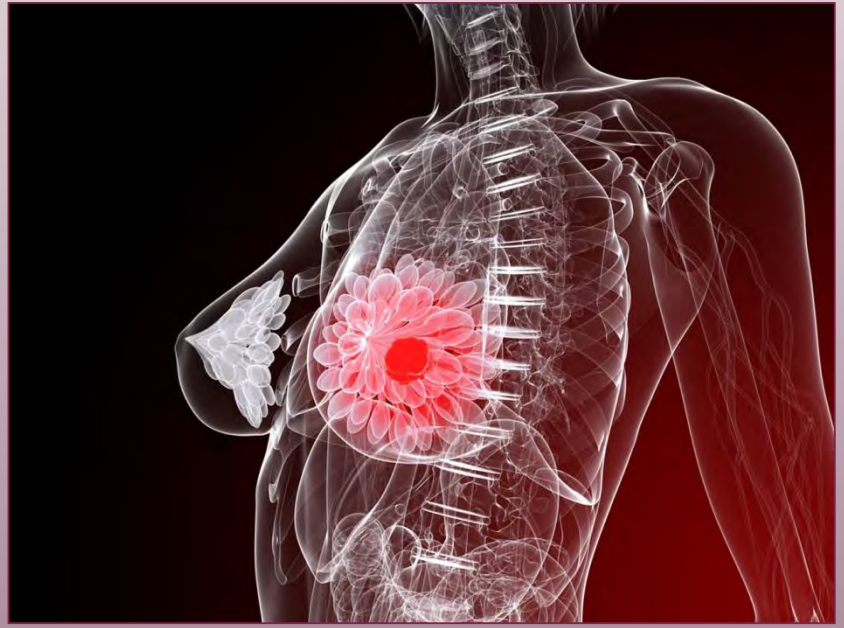
Personalised management is considered the future of cancer care: medicine aiming at giving patients the best treatment according to

- their personal medical history,
- their physiological status
- and the molecular characteristics of their tumours.

RATIONALE

The whole breast irradiation is not always the most convenient treatment for age, comorbidity, logistical and socio-economic reasons.

To reduce the radiation treatment time and to control tumor disease in breast area with the higher risk of relapse, was proposed Partial Breast Irradiation (PBI).



9th International ISIORT Conference June 24/25th 2016 Novara, Italy

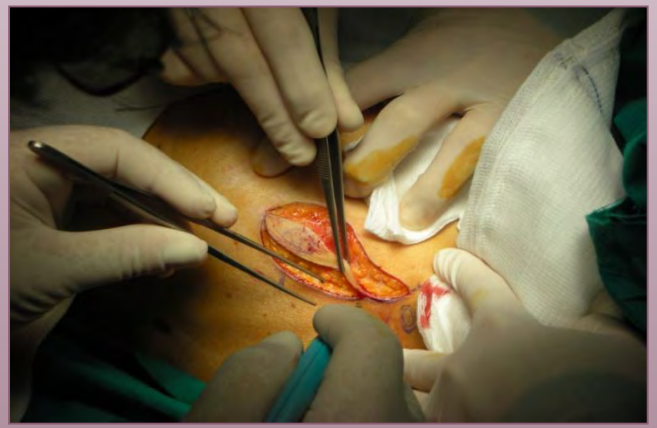
IOERT: EXPERIENCE

In our center we use a mobile linear accelerator, the NOVAC 7, as approach to deliver partial breast irradiation or as tumor bed boost for the breast cancer (electron beam energy from 3 to 9 MeV)

From february 2005 to april 2016

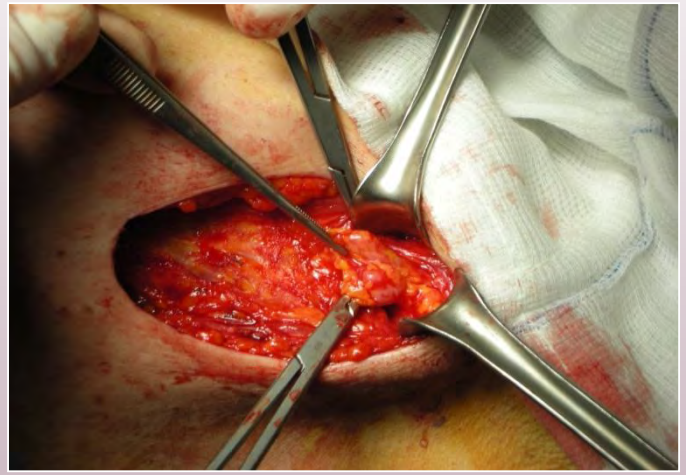
703 cases of breast cancer received IOERT immediately after breast resection with

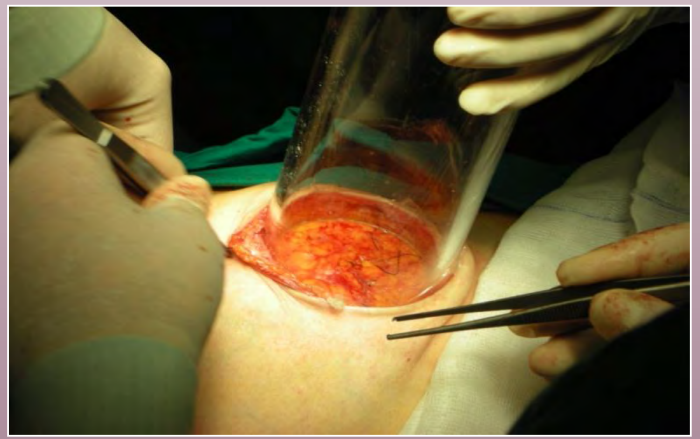
SINGLE DOSE	BOOST
21 Gy	10 Gy



IORT: ADVANTAGES

- Direct visualisation excludes the danger of geographical miss
- Exposes the area with a higher risk to a highly effective single dose
- Shortening total treatment irradiation time
- Sparing the skin in order to have a better cosmesis

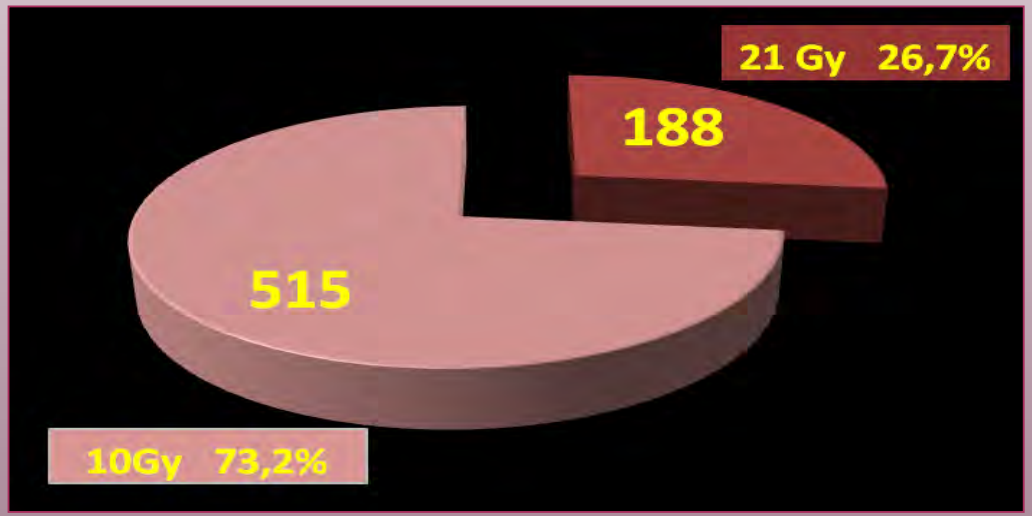


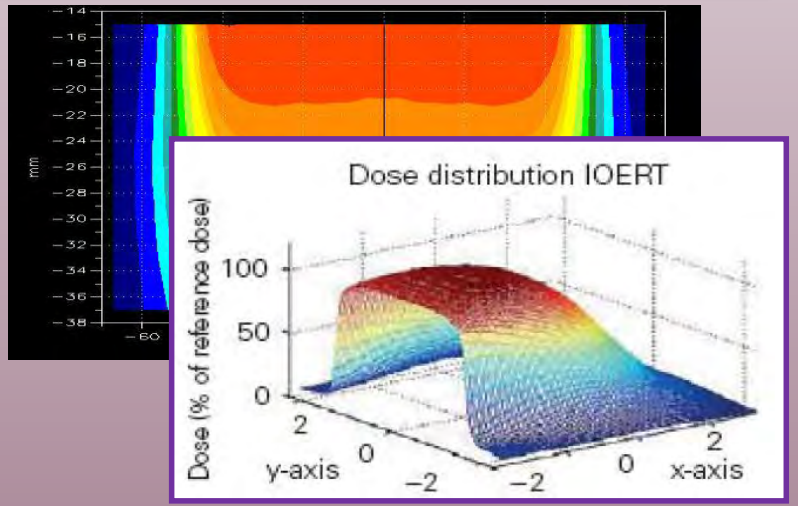


IOERT: EXPERIENCE

188 patients
were treated with a
Single dose IOERT
of 21 Gy

515 patients
were treated with dose
of 10 Gy, as anticipated
boost, followed by 44-50 Gy
whole-breast
external-beam radiotherapy





IOERT: EXPERIENCE

All cases are evaluated by multidisciplinary team made up of surgeon, radiologist, radiation oncologist, medical oncologist, pathologist, nurses and radiographers

Usually preoperative diagnosis is histological with predictive parameters:

type
grading
ER
PR
Ki-67
HER 2

IOERT: EXPERIENCE

We evaluated 635 pts with a follow-up >12 months:
456 treated with IOERT as anticipated boost and 179 treated with IOERT single dose.
The median follow-up was 54 months for boost group and 70 months for the IOERT single dose group.

Hypofractionated Whole-Breast Irradiation preceded by Intra-Operative Radiotherapy with Electrons as anticipated Boost

HIOB

A new Option in Breast-Conserving Treatment for Operated Breast Cancer Stages I and II

Prospective one-armed multi-center-trial

ISIORT 01

ClinicalTrials.gov Identifier: NCT01343459

5.5. HIOB Trial

Hypofractionated Whole-Breast Irradiation following Intra-Operative Electron Boost. (http://www.clinicaltrials.gov/ct2/show/NCT01343459?term=hiob&rank=1).

In an attempt to further reduce overall treatment duration without compromising local control rates, the multicentre HIOB trial was started in January 2011 as an ISIORT investigator initiated study. In this trial, Boost IOERT of 10 Gy is combined with hypofractionated WBI (15 × 2.7 Gy) for stage I/II breast cancer. A similar concept of IOERT plus short-term WBRT was tested in a phase II design by the Milano Group [38]. The HIOB trial design follows a sequential probability ratio test (SPRT), defining annual in-breast recurrence rates as benchmarks for successful treatment. Superiority of the intervention is defined by falling below the best published evidence in non-IORT cohorts. Beside tumor-related endpoints, major emphasis is made on cosmetic outcome, where a first analysis on early results is available [44].

IOERT SINGLE DOSE: Patients characteristics

Patients: 179

IDC: 166 pts

ILC : 10 pts

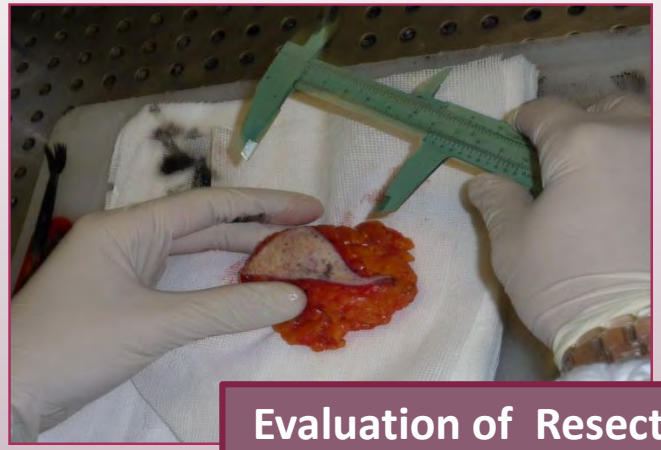
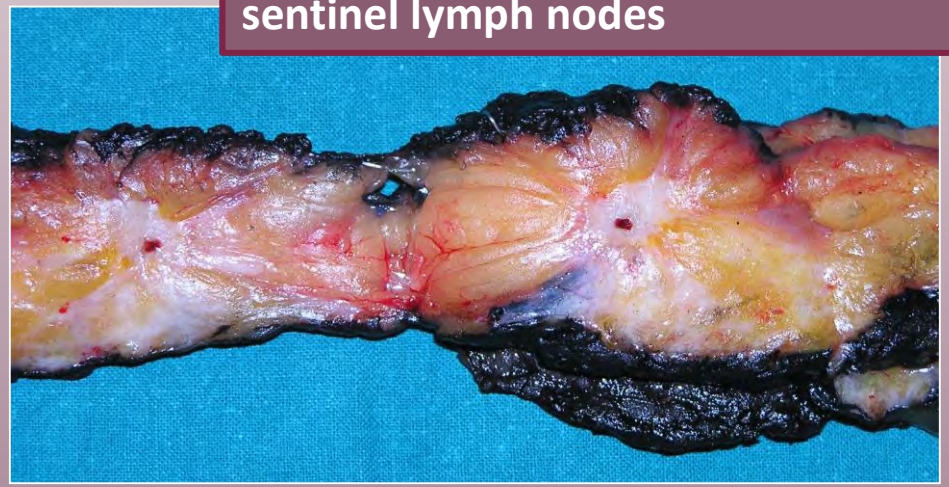
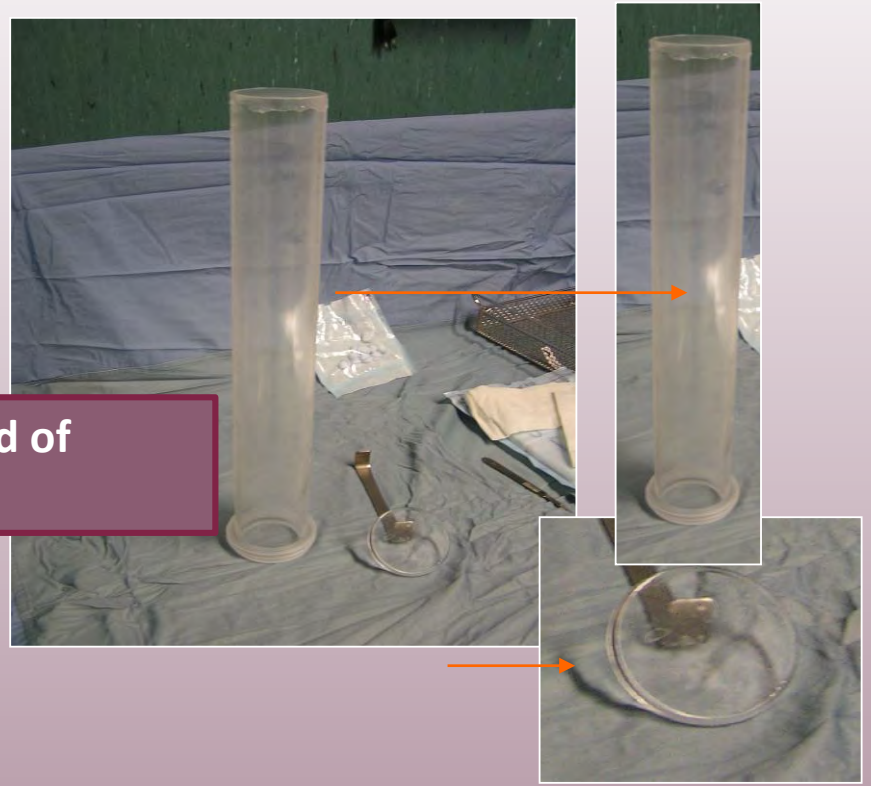
From 2010 we considered ASTRO parameters to select patients suitable for the single dose

IORT: EXPERIENCE



Evaluation of Resection Margins and of sentinel lymph nodes





PTV : GTV + 2 or 3 cm

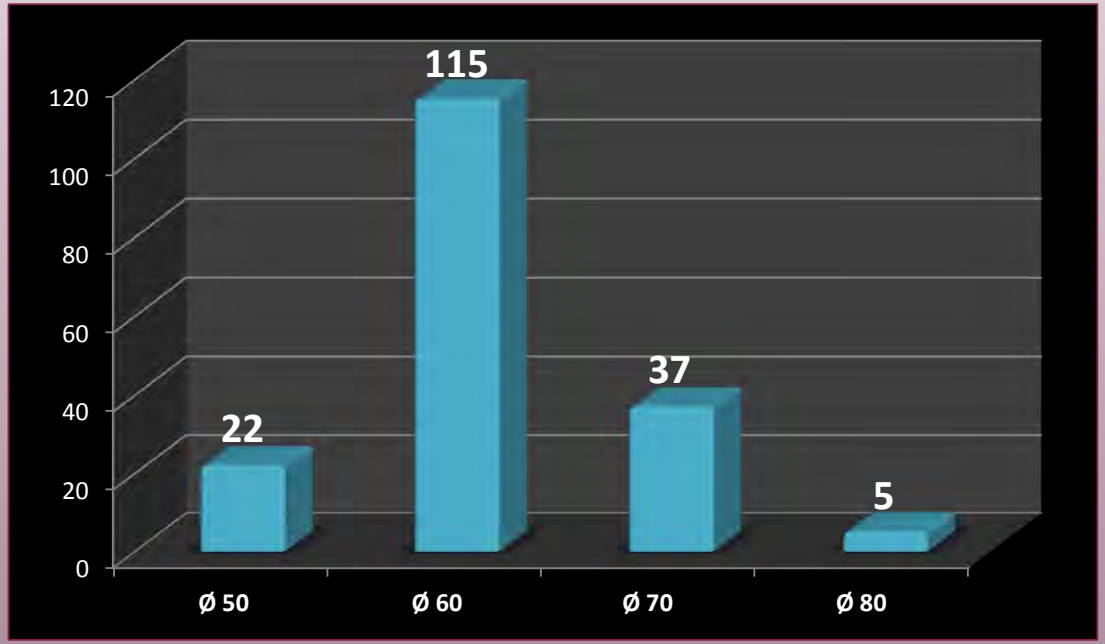
IOERT SINGLE DOSE: Treatments characteristics

Patients: 179

Electron energy: 7 – 9 MeV

Dose: 21 Gy, reference isodose 90%

Diameter applicators: 6 cm (from 5 to 8 cm)



RESULTS 1

- **No** surgical or radiation **complications** have been observed.
- The **compliance** to treatment has been **very good**.
- The cosmetic results are generally good

RESULTS 2

To date we observed:

- **4 local recurrences** in the first group (**boost**)
- **6 recurrences out of** the primary tumor quadrant in the second (**single dose**)

2 patients developed a lymphnode recurrence:

- the first in the boost group
- the second in the single dose group

4 of the 6 patients, who have been treated with IOERT single dose did not meet the ASTRO parameters according to grading, tumor size and state of the sentinel nodes.

RESULTS 3

37 pts developed distance metastasis:

- 32 pts in the boost group
- 5 pts in the single dose group

17 pts died for cancer:

- 13 boost group
- 4 single dose

25 pts died for other reasons

28 pts were lost during the follow-up

9th International ISIORT Conference June 24/25th 2016 Novara, Italy

CONCLUSION 1

IOERT should be now considered as an alternative to EBRT for specifically selected and well-informed patients

IOERT with a single dose is feasible, well tollerated and very well accepted by patients not suffering a long cycle of radiotherapy

In our experience it resulted an appropriate technique for the PBI, providing direct localization of the tumor bed and minimizing the damage to normal tissues.

CONCLUSION 2

One of the main limitations in the use of IORT is the lack of histological information.

A careful selection of patients who may benefit from a partial breast irradiation is needed.

We believe that the core-biopsy examination can be very predictive and therefore mandatory before an exclusive treatment.

The close and constant collaboration with the surgeon and the pathologist has been essential in the improvement of the entire procedure.

CONCLUSION 3

Our data suggest that the **anticipated boost is associated with a low incidence of local recurrence** and can be considered equivalent to the external boost in terms of acute and late toxicity.

IOERT as a boost could be an **alternative to post-operative boost** with a more accurate dose distribution, allowing smaller volumes of the treatment and reducing post-operative radiotherapy time.

INTRAOPERATIVE RADIOTHERAPY FOR EARLY BREAST CANCER:

A MONOCENTRIC EXPERIENCE

A. Baldissera

Preliminary results of patients treated with IORT at Bellaria Hospital, Bologna, Italy.

Radiotherapy Unit, Dr. G. Frezza

Breast Surgery Unit, Dr.ssa M.C. Cucchi

INTRODUCTION

- Single-dose intraoperative radiotherapy (IORT) is an alternative treatment for selected cases of early stage breast cancer.

- Intraoperative radiotherapy should be part of discussions to decide a personalised treatment regimen.

Veronesi U. et al. ELIOT Trial. Lancet Oncol. 2013;14:1269-77

- Risk-adapted approach should be considered as an option for eligible patients with breast cancer carefully selected.

Vaidya JS et al. TARGIT-A randomised trial. Lancet. 2014;383:603-13

METHODS
-Outcome measures-

- Histopathology
- Adjuvant treatment
- Clinical tolerability
- Local recurrences
- Overall survivor (OS)

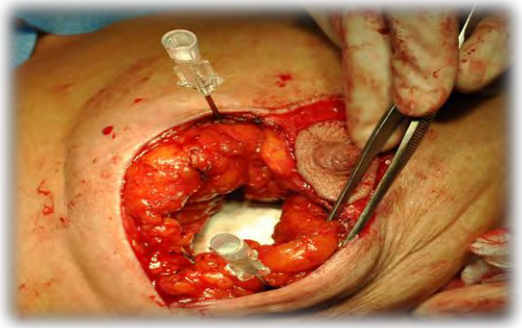
24 JUNE 2016 NOVARA, ITALY

METHODS
-Selection Criteria

- We analysed data of 108 women who underwent conservative surgery and IORT with primary intent, from January 2011 to December 2015.

- Early breast cancer

- Age ≥ 60 y



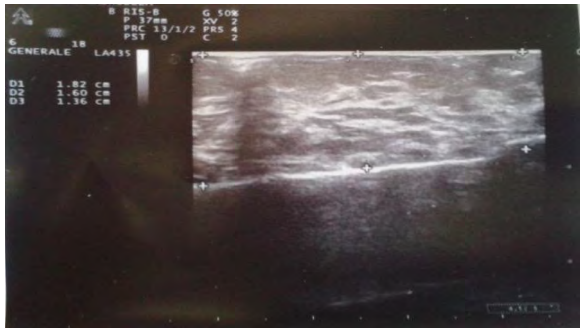
SURGERY

- Surgery was performed in the operating IORT room
- Surgical technique for IORT: quadrantectomy and evaluation of sentinel node
- Residual mammary gland preparation as described by Veronesi et al.
- Margin of resection evaluated by macroscopic assessment with frozen section on specific sites.

IORT

- Dedicated mobile electron accelerator (LIAC)
- 21 Gy were prescribed at 90% isodose

- Energy beam: 4-6-8-10 MeV electron beam ; energies according to the tissue thickness measured by ultrasonography of the breast portion to be irradiated



- Collimation by hard-docking system
- Applicators diameter: 4 5-6-7-8 cm
- Bevel Angle (degree): 0°-15°

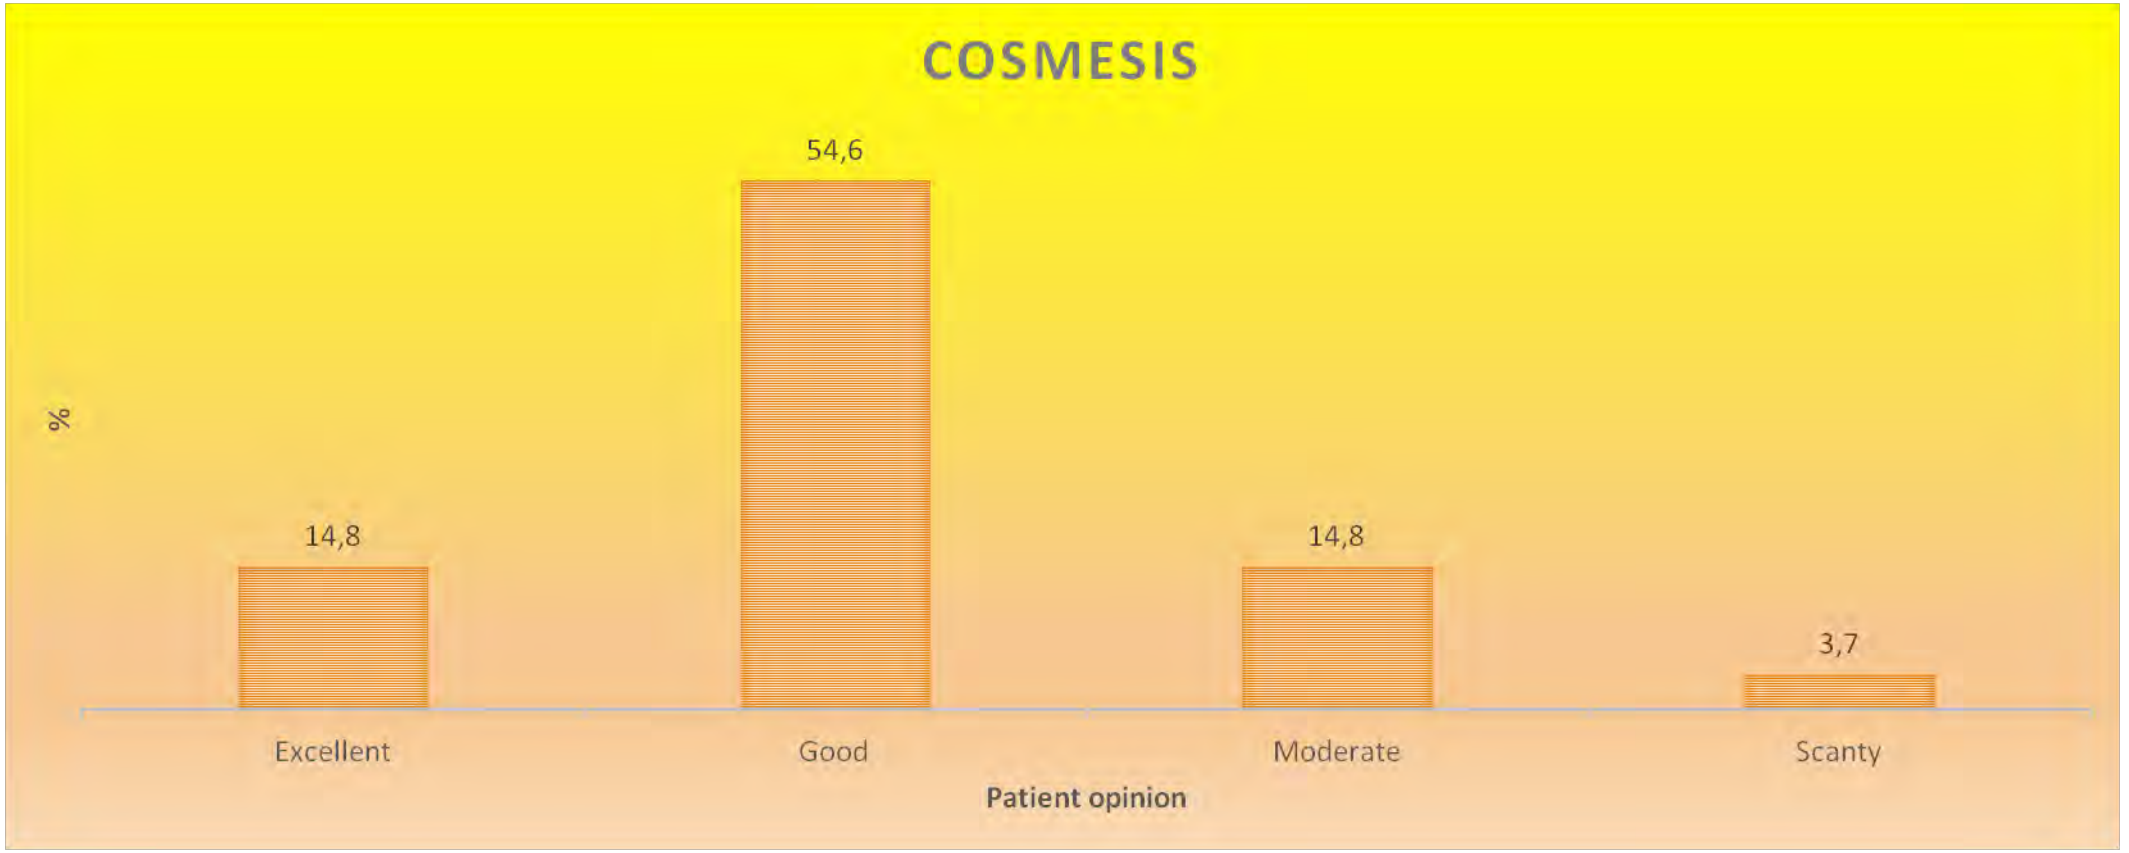
COSMETICS RESULTS



CONCLUSIONS

- IORT represents a safe and effective alternative treatment option in selected patients with early breast cancer
- Low complications rate with good clinical and cosmetic outcomes support IORT as a treatment option for selected women.
- The short follow-up, for about half patients, does not allow an accurate analysis of DSF and OS

Intraoperative Radiotherapy of Breast Cancer: Analyses of Data from 3 centers in Turkey

Conclusions

- Total number of patients underwent IORT is less than expected.

  - Reimbursement procedures by the government and private insurance companies

  -Selection of patients for PBI with IORT; needs a comprehensive work-up

  -NAC sparing surgery is also performed in centers dedicated to breast cancer treatment and selection of patients for EBRT, NAC RT or without any RT needs expertise

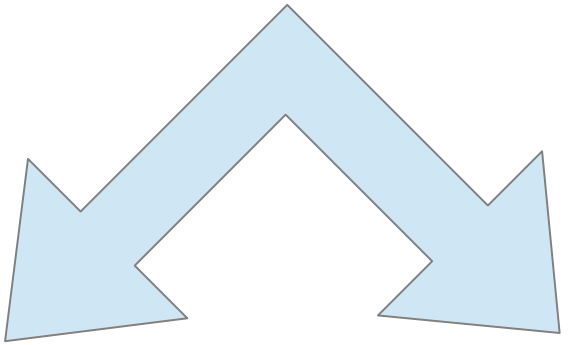
SINGLE CENTRE RETROSPECTIVE CASE-CONTROL STUDY



IORT EBRT

EARLY STAGE BREAST CANCER

INDICATIONS for IORT

- From 2004 to December 2014, 212 patients with Stage I-II breast cancer were treated with IORT
- Until 2009 the patients were included in“REGINA ELENA randomized study»
- From 2009 we adopted the **ESTRO guidelines** and at the same time we selected, as control group with similar characteristics, who received external beam whole breast radiotherapy (EBRT).

“REGINA ELENA STUDY” CRITERIA

CHARACTERISTICS OF NOVAC 7

Characteristics:

Linear Accelerator electrons releasing.

4 different energetic levels: (3, 5, 7, 9 MeV)

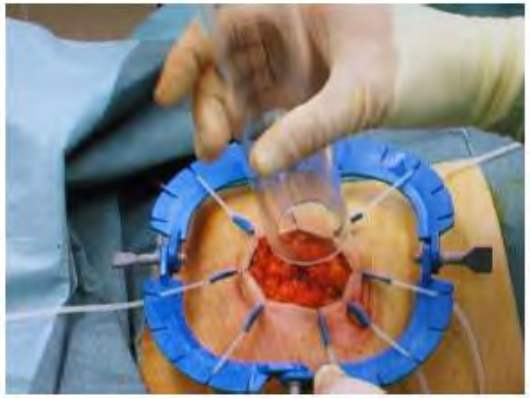
High dose rate

Variable dedicated applicator from 4 to 10 cm diameter

IORT: MODALITY OF EXECUTION

- QUADRANTECTOMY sec. Veronesi and sentinel lymph node biopsy
- According to the dimensions of the lesions and to the histologic results from the extemporaneous biopsy we established the dimensions of collimator (from 4 to 8 cm).
- Delivered Energy 9 MeV
- The prescribed dose was 21 Gy, isodose at 90% in one fraction
- Time of irradiation 60 sec

Attenuator disk is placed between the pectoralis muscle and the residual gland



Perspex Collimator is introduced through the skin and placed directly in contact with the breast target

NOVAC sterile applicator in the operating theatre

EBRT

EBRT was performed through 3D conformational technique by LINAC ONCOR

The dose delivered was 50 Gy in 25 fractions to whole breast with boost tumour bed 10 Gy in 5 fractions or 42,56 Gy in 16 fractions with boost 10 Gy in 5 fractions.

COSMETIC RESULTS

- The evalutation of cosmetic result is based on the following parameters:
  - Simmetry and shape of the breast
  - Surgical wound
  - Cutaneus pigmentation

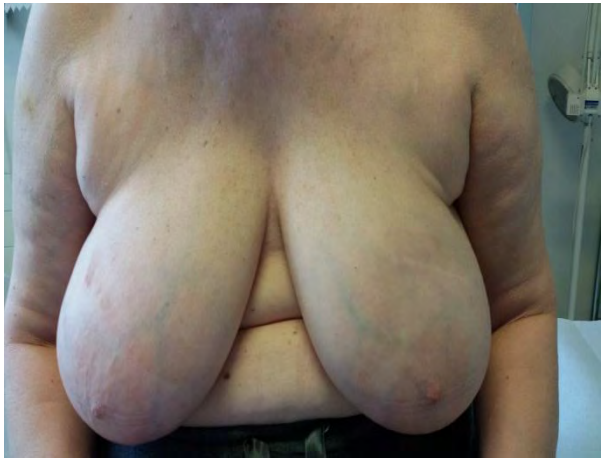
  } 12 months after IORT

- Combining them we established this cosmetic scale:
  - Excellent
  - Good
  - Fair
  - Poor

COSMETIC RESULTS

	IORT		EBRT	
	frequency	%	frequency	%
EXCELLENT	7	3,3	37	17,5
GOOD	182	85,8	127	59,9
FAIR	14	6,6	41	19,3
MEDIOCRE	-	-	1	5
POOR	8	3,8	6	2,8
ASYMMETRY	1	5	-	-

EXCELLENT



GOOD

POOR

CONCLUSIONS

No statistically significant difference between IORT and EBRT group concerning local relapses.

Therefore IORT seems to be valid alternative to EBRT in selected patients with low risk disease, providing an effective local control of the neoplasia

Furthermore:

- Cosmetic results are satisfactory
- Low cost and easy logistic management
- No interferences with CT
- Performed directly during surgical session

STUDY PROTOCOL Open Access

TARGIT-E(lderly)—Prospective phase II study of intraoperative radiotherapy (IORT) in elderly patients with small breast cancer

Christian Neumaier[1*], Sperk Elena[1], Welzel Grit[1], Abo-Madyan Yasser[1,2], Kraus-Tiefenbacher Uta[1], Keller Anke[1], Gerhardt Axel[3], Sütterlin Marc[3] and Wenz Frederik[1]

Abstract

Background: Patients ≥ 70 years with small, low-risk breast cancer who are operated but not irradiated how local relapse rates around 4% after 4 years. With adjuvant whole breast radiotherapy (WBRT) the local relapse rate drops to 1% after 4 years under Tamoxifen. It has been demonstrated that the efficacy of radiotherapy of the tumor bed only in a selected group can be non-inferior to WBRT.

Methods/Design: This prospective, multicentric single arm phase II study is based on the protocol of the international TARGIT-A study. The TARGIT-E study should confirm the efficacy of a single dose of intraoperative radiotherapy (IORT) in a well selected group of elderly patients with small breast cancer and absence of risk factors. Patients will receive IORT (20 Gy with Intrabeam system/Carl Zeiss) during breast conserving surgery. In presence of risk factors postoperative WBRT will be added to complete the radiotherapeutic treatment according to international guidelines. Endpoints are

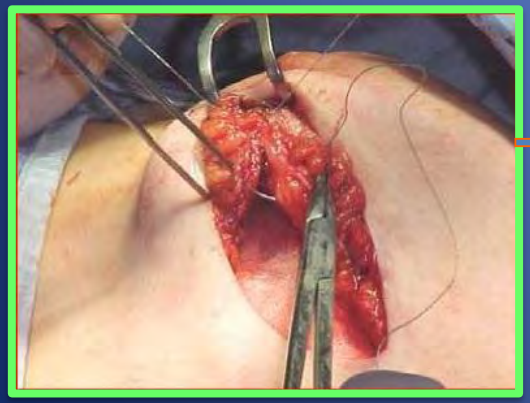
IORT STEPS

Conserving surgery

insertion protection disc

Temporary suture and thickness measurement



Distal collimator placement

Docking done

Methods

From 2009 to May 2016 we were treated with intraoperative radiotherapy (IORT) as a radical treatment of 498 patients with breast carcinoma after conservative surgery

Methods

Until December 2013, the enrollment of patients was done according to the protocol of the Emilia Romagna Region IRMA 3 .

From 2014 in accordance with the guidelines Italian Association of Radiation Oncology (AIRO) for breast IORT

IRMA3 inclusion criteria:

Until December 2013

.cytological or histological preoperative or intraoperative invasive non lobular carcinoma

* Age ≥ 50 years female

* Performance status: 0-2 ECOG

* life expectancy of at least 5 years

* cT 1-2 (<2.5 cm in diameter) CN0 M0 according to the TNM classification, candidates for conservative surgery

* negative intra or preoperative sentinel lymph node

* No microcalcifications peritumoral for DCIS on mammography

*Unifocal disease

*informed consent

AIRO criteria:

from january 2014

- Age ≥ 50 years female
- Unifocal disease
- histological preoperative invasive non lobular carcinoma
- T ≤ 2 cm
- favorable biological profile disease (LUMINAL A ER+ RPg+ Her2- Mib1 < 20% G2)
- N0
- Negative margins

All patients received a dose of 21 Gy isodose of 90% with energy as a function of the thickness of the breast volume.

Results (Only local recurrence analyzed)

- Three of the 498 patients (0.6%) had a local recurrence of the disease. One patient had an axillary lymph node recurrence, one patient had recurrence in the same quadrant and one patient in a different quadrant.

Conclusion

- The preliminary results of our experience confirms the feasibility of intraoperative treatment in terms of local control in the subset of low-risk patients in line with the most recent trials. It is however necessary a longer follow-up and a more accurate analysis of the data.
- Also in the selection of patients it is important to assess the location of the disease and the volume of the gland (thickness) for the feasibility of the treatment

CONCLUSIONS

Preoperative selection

- Age > 50
- Non lobular histology
- Tumor size ≤ 2 cm
- cN0 and uN0

- Ki67 ≤ 20%
- NTN receptor status
- G1-G2

Thank you

بسم الله الرحمن الرحیم

Conclusion

➢ IOERT as a Boost:

- Enables *High Local control rate* in patients with an unselected risk profile after 10-years FUP
- First IBR were observed *median 7 years* after IOERT
- *Possible Risik factors:* G3, TNBC,non-luminal, <50 Y, multifocality, or tube diameters < 6 cm

INTRAOPERATIVE ELECTRON BOOST RADIOTHERAPY (IOERT) FOR EARLY BREAST CANCER: INSTITUTIONAL EXPERIENCE (2009-2015)

LEONARDO GUERRERO
Department of Radiation Oncology Gregorio Marañón General University Hospital

PURPOSE:

To assess feasibility, toxicity and cosmetic results of IOERT during breast conserving surgeries for early breast cancer.

Hospital General Universitario Gregorio Marañón
SaludMadrid
Comunidad de Madrid

Department of Radiation Oncology and Gynecology

PATIENTS AND METHODS:

<u>February 2009-May 2015</u>:

- 63p : Early BC → breast conserving surgery + IOERT.
- Adapted to results of sentinel lymph nodes biopsy.

35 = **21Gy** (single dose)

28 = **10Gy boost** + conventional regimen of external beam radiotherapy

9th International ISIORT Conference

Hospital General Universitario Gregorio Marañón

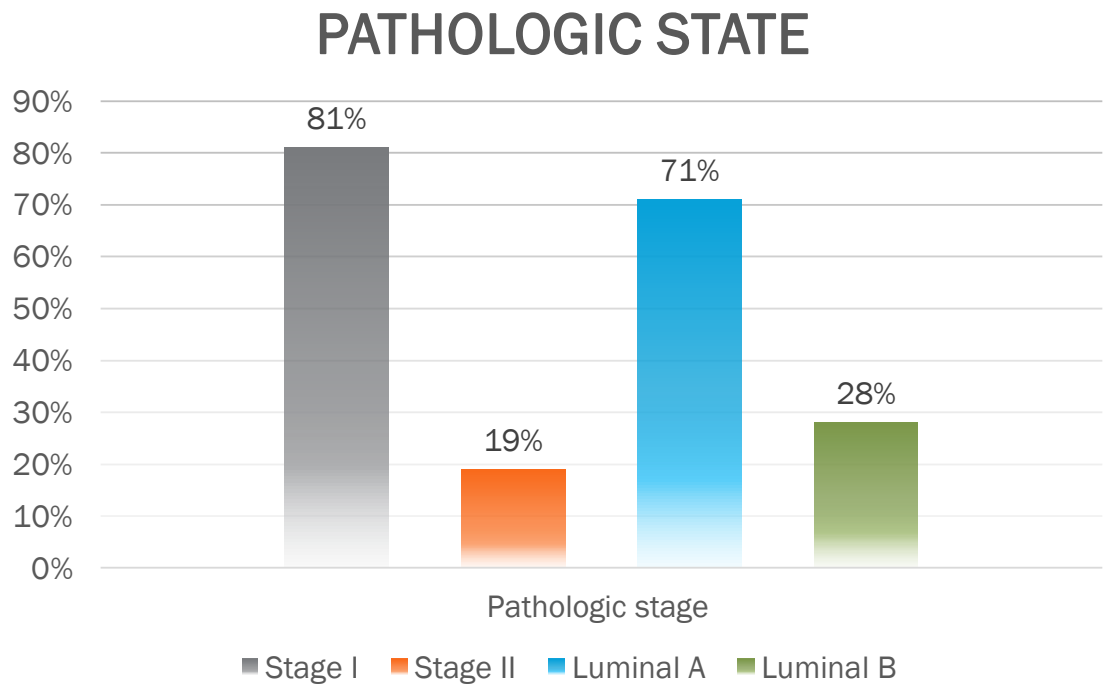
SaludMadrid

Comunidad de Madrid

Department of Radiation Oncology and Gynecology

RESULTS:

Median age: 69 year-old (43-91).
Median Follow up: 41 months (4-88).



9th International ISIORT Conference

Hospital General Universitario Gregorio Marañón
SaludMadrid
Comunidad de Madrid

Department of Radiation Oncology and Gynecology

RESULTS:

Electron energies: 6-12 MeV.

6 MeV 78%.

Applicator diameter: 5 cm (71%).

Beveled end of 0º, 15º, 30º were 43%, 33%, 24% respectively.

We used metallic internal patient-shielding in all procedures.

RESULTS:

Time for wound healing was ≤ 15 days in 95%.

Cosmetic results (NSABP/RTOG scale), were:

- Excellent 10 (18%).
- Good 38 (69%).
- Fair 7 (13%).

There was no local relapse.

5-yr Overall Survival (OS): 94% (Only two patients died for no tumor reasons).

CONCLUSIONS:

In selected population (based on ESTRO/ASTRO criteria) IOERT is an attractive accelerated partial breast irradiation technique, secure, repeatable, with low toxicity and good cosmetic results.

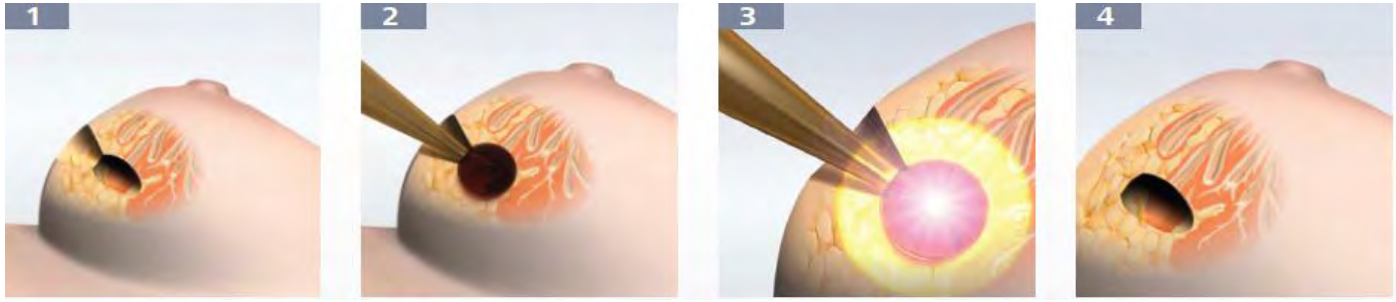
Risk factors for intramammary breast cancer recurrence after intraoperative radiotherapy (IORT)

Elena Sperk,

Philipp Teich, Christel Weiß, Marc Sütterlin, Frederik Wenz



Rationale

- There are known risk factors for recurrence after breast cancer with breast conserving therapy
- Up to date no special analysis of risk factors after intraoperative radiotherapy (IORT) for breast cancer are published.

Aims

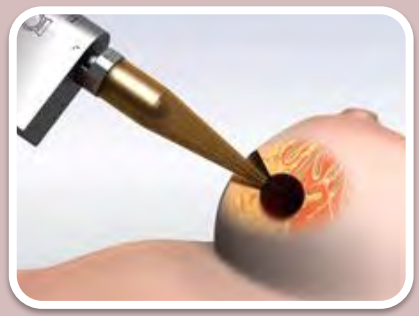
1) To identify risk factors for local, ipsilateral and contralateral recurrence
2) Create a risk classification.

Methods

02/2002-
08/2011

N = 398 patients

treated in breast cancer center Mannheim



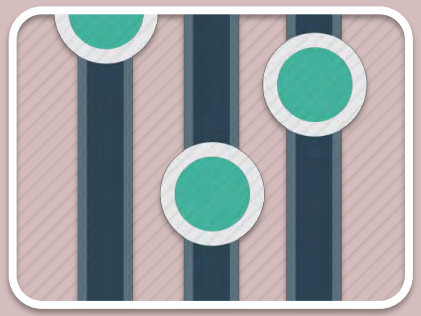
N = 285

IORT Boost

+ EBRT 46-50Gy

N = 113

IORT alone



Parameter:

age, TNM status, grading, histology (lobular vs. no special type), lymphovascular invasion, hormone receptor status, Luminal A/B/triple negative, uPA/PAI, number of resections, resection status, EIC, adjuvant therapy, localization of the tumor and recurrence

(univariate analysis):

1) local recurrence (< 2 cm of the tumorbed)

2) ipsilateral recurrence (> 2 cm of the tumorbed)

3) contralateral recurrence

4) control group with no recurrence

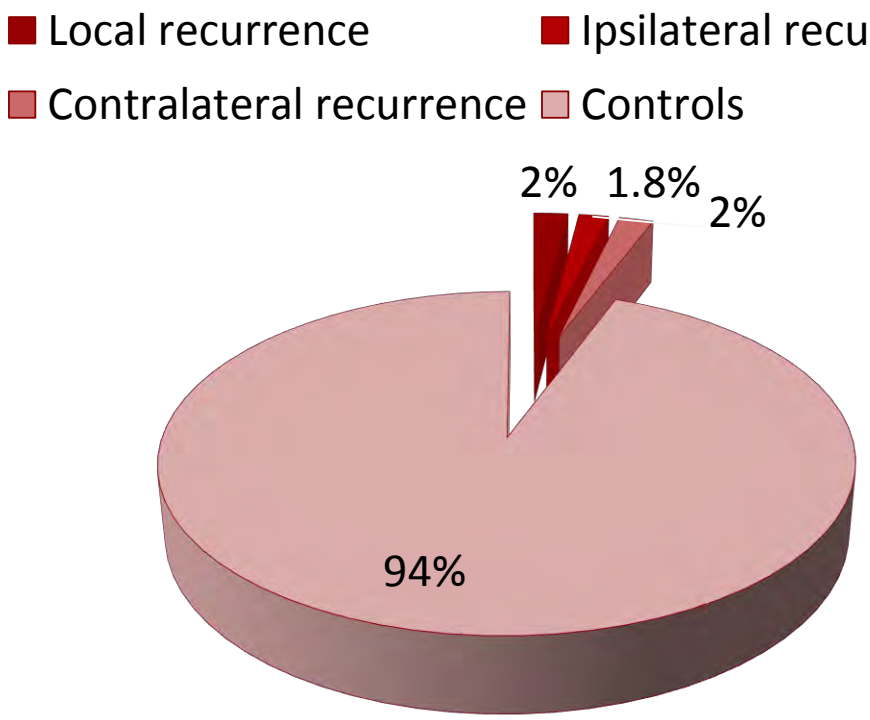
Unknown	0 (0.0%)	0 (0.0%)	0 (0.0%)	2 (0.5%)

Results: Risk factors



- Age (mean) 63.8 years
- Median F/U 44.2 months

Risk factors for **contralateral recurrence**:
- **pN1 + L1**

Risk factors for **ipsilateral recurrence**:
- Triple-negative tumor
- Less number of intraoperative re-resections
- **pN1 + L1**

Risk factors for **local recurrence**:
- Young age
- Therapy with Bisphosphonates
- Medial Tumor localization
- Resection margin < 1mm
- Less number of intraoperative re-resections
- **pN1 + L1**

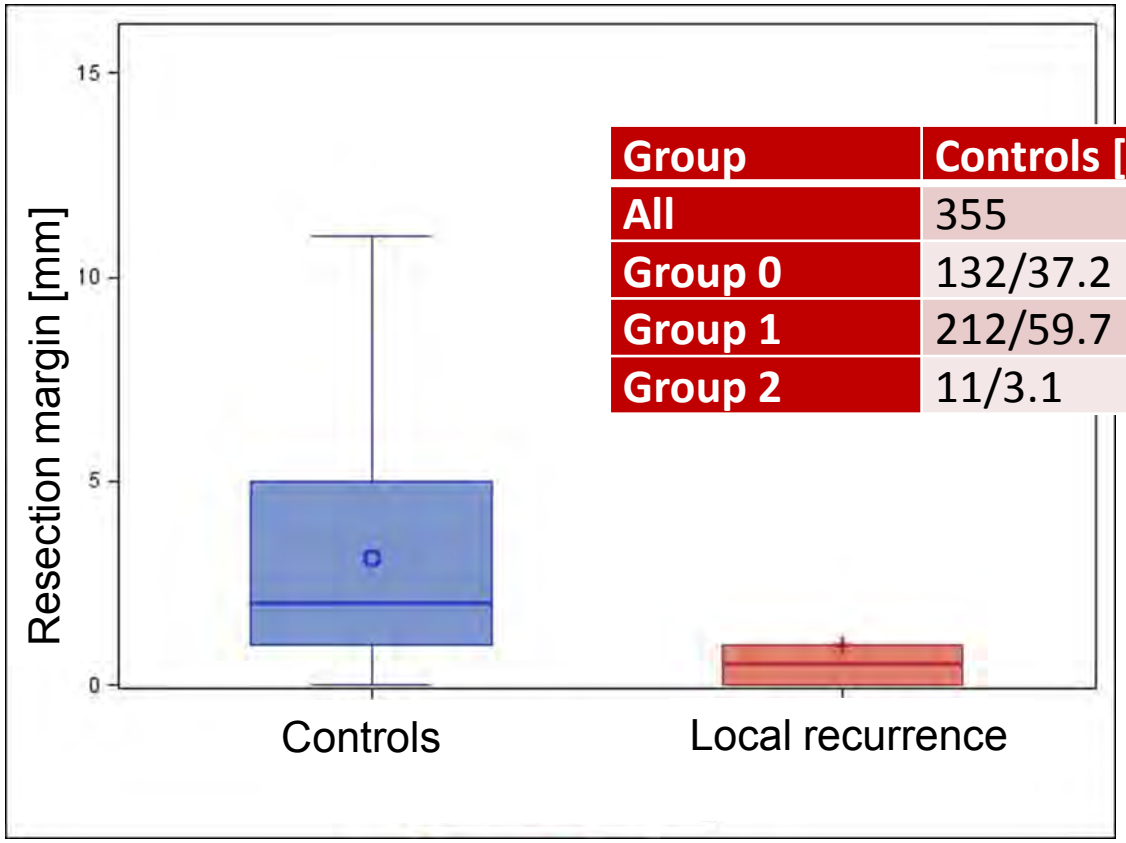
Results: Resection margin

Boxplot: minimal Resection margin in controls and local recurrence patients



Group	Controls [n/%]	LR [n/%]	p
All	355	13	0.06
Group 0	132/37.2	8/61.5	
Group 1	212/59.7	4/30.7	
Group 2	11/3.1	1/7.7	

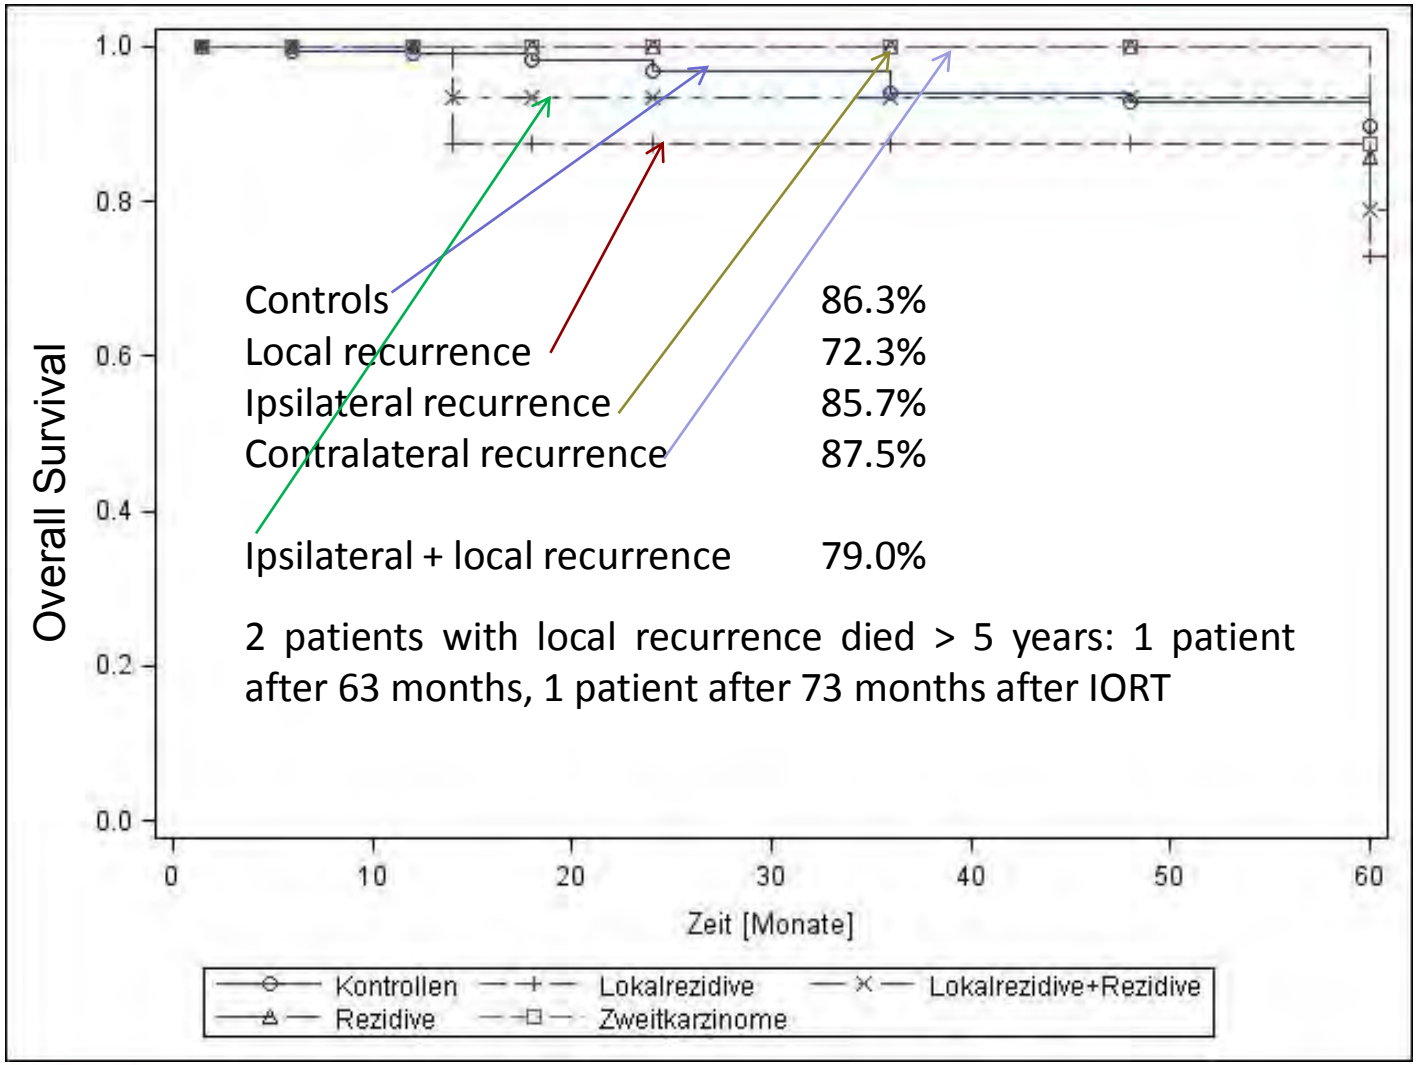
Group 0: ≤ 1 mm
Group 1: 1.1 - 9.9 mm
Group 2: ≥ 10 mm

Results: Risk constellation

Risk for intramammary recurrence after IORT
(Local recurrence, ipsilateral or contralateral recurrence)

Risk [%]	<5		5-10		>10	>15	
T	1-2	1-2	1-2	1-2	1-2	1-2	1-2
N	1	0	0	0	0	1	0
G	1-2	1-2	1-2	3	1-2	1-2	1-2
L+	-	-	-	-	+	+	-
Histology	Ductal	Lobular	Ductal	Ductal	Ductal	Ductal	Ductal
Triple-negative	-	-	-	-	-	-	+

5 Year Overall Survival



Controls	86.3%
Local recurrence	72.3%
Ipsilateral recurrence	85.7%
Contralateral recurrence	87.5%
Ipsilateral + local recurrence	79.0%

2 patients with local recurrence died > 5 years: 1 patient after 63 months, 1 patient after 73 months after IORT

Conclusion: Risk factors IORT

- ✓ Low recurrence rate after IORT regarding local, ipsilateral or contralateral recurrence. Good overall survival.
- ✓ Known risk factors: young age, lymphovascular invasion, medial tumor localization, neg. hormone receptors, resection margin < 2 mm.
- ✓ No risk factors: tumor size, positive lymph nodes, histological type (lobular vs. ductal)
- ✓ High risk constellation: Combination of positive lymph nodes and lymphovascular invasion and secondly triple negative tumors.

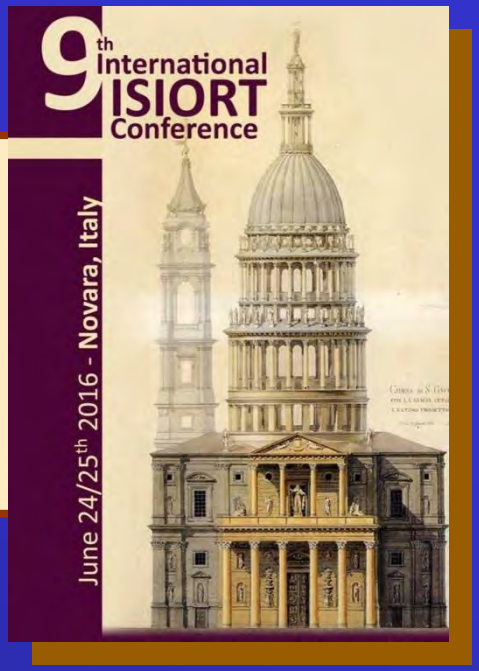
Intraoperative Ultrasound role on breast Intraoperative Electron Radiation Therapy (B-IOERT) boost



Cristiana Vidali
S.C. Radioterapia
A.S.U.I. Trieste

IORT as anticipated boost: clinical rationale

To date, every interim analysis showed lower local recurrence rates than standard treatment schedules

ADVANTAGES:

- No topographic miss
- More favourable radiobiology of a single dose (α/β)
- Shorter radiation time (< 1–2 weeks)
- Good dose distribution
- Complete skin sparing
- Minimal toxicity in the long-term follow up

DRAWBACKS:

- Uncertainty of the final pathologic report
- Lack of definition of the resection margins

IOERT in Trieste

CASTELLO DI MIRAMARE. Veduta del porticciolo, riserva marina del WWF. © APT Trieste - ph.: Alessandro Savella.

The first case of IOERT in Trieste
June 22, 2012

IOERT Trieste Protocol

➢ IOERT as anticipated boost:

- 10 Gy (max. dose). The PTV should be encompassed by 90% of the prescribed dose (i.e. 9 Gy). Dose inhomogeneity: -10% within the target volume is allowed

➢ Standard WBI:

- 50 Gy – 2 Gy in 25 fr.
- Start:
  - ≤ 12 weeks from surgery without adjuvant CT
  - ≤ 35 days from the end of CT and < 6 months from surgery

LANDESKRANKENHAUS SALZBURG
UNIVERSITÄTSKLINIKUM
DER PARACELSUS MEDIZINISCHEN PRIVATUNIVERSITÄT

IORT

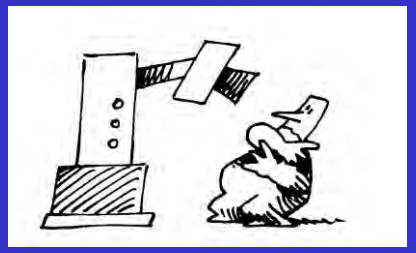
HIOB Protocol
Prospective one-armed multi-center-trial

- **IOERT as anticipated boost:** dose: 11.1 Gy (max. dose)
  + hypofractionated WBRT: total dose 40.5 Gy - 2.7 Gy/fr. in 15 fractions – 5 fr./week

- **Clinical rationale:** it combines the advantages of hypofractionated WBRT as well as IOERT-boost, which seems to be superior to other boost strategies in terms of local tumour control, with less acute toxicity and late toxicity equivalent to standard RT schedules

- **WBI must start :**
  - not before day 36 until day 56 postop. without adjuvant CT
  - ≤ 21 days from the end of CT and ≤ 9 months from surgery

IOERT:
the experience of Trieste



- From June 2012 to April 2016:
  75 cases (74 patients, one with synchronous bilateral cancer)
- ***Median age:*** 67 years (range:47-85)

- ✓ Average difference calculated on 5 points in the tumour bed: 0.5 mm
- ✓ In vivo dosimetry confirmed that IOUS application reduced the misalignment, in terms of irradiated area outside the shielding disk from 5.6 cm^2 to 2.6 cm^2
- ✓ The percentage of patients in which the electron field was totally inside the shield moved from 23% to 68%

Final revision after the introduction of the IOUS probe

IOUS probe application:

- to measure the target thickness
- to check the position of the shielding disk

Overall acute toxicity	26 (52)	8 (34.75)	34 (46.5)

Conclusions

- IOUS proved to be accurate in evaluating the target depth
- After its introduction in the clinical practice very good results, in terms of the dose delivered and shielding alignment, have been obtained. The results show a significant reduction of the undesiderable dose and an important contribution in the optimization of patient safety
- Furthermore IOUS helped to reduce treatment related toxicity

IOERT Trieste Protocol

➢ *Inclusion Criteria*

- Age: ≥ 18 years
- Surgery: QUAD + SLB or axillary dissection
- Preop. cytological and/or histological diagnosis of unifocal invasive carcinoma
- Stage: cT1-T2 (< 2.5 cm); cN0/N1; cM0
- All grades and receptor status (G1-G3, any HR and Her-2)
- R0 ≥ 2 mm
- Written informed consent of the patient

➢ *Exclusion Criteria*

- Age < 18 years
- LCIS, DCIS, Paget disease, non epithelial tumours
- Invasive multifocal or multicentric carcinoma or EIC
- Stage: cT2 (> 2,5 cm), T3, T4; cN > 1; cM1
- R1 or R0 < 2 mm
- Karnofsky Index < 70
- Neoadjuvant CT
- General contraindications to RT
- No written informed consent of the patient

HIOB Protocol

Inclusion Criteria

- Age: ≥ 35 years
- Histological diagnosis of unifocal or multifocal (max. distance < 5 cm) invasive carcinoma
- Stage: T1-T2; N0/N1; M0
- All grades and receptor status (G1-G3, any HR and Her-2)
- R0 no ink on tumors (invasive or in situ)
- Written informed consent of the patient
- Adjuvant and neoadjuvant CT: allowed

Exclusion Criteria

- Age < 35 years
- LCIS, DCIS
- Invasive multicentric or multi-focal (max. distance > 5 cm) carcinoma
- Stage: T3, T4; N > 1; M1 - R1
- Re-excision after IOERT or immediate secondary mastectomy
- Previous RT to the involved breast
- Breast size (PTV) > 2500 ml
- Karnofsky Index < 70
- General contraindications to RT
- No written informed consent of the patient

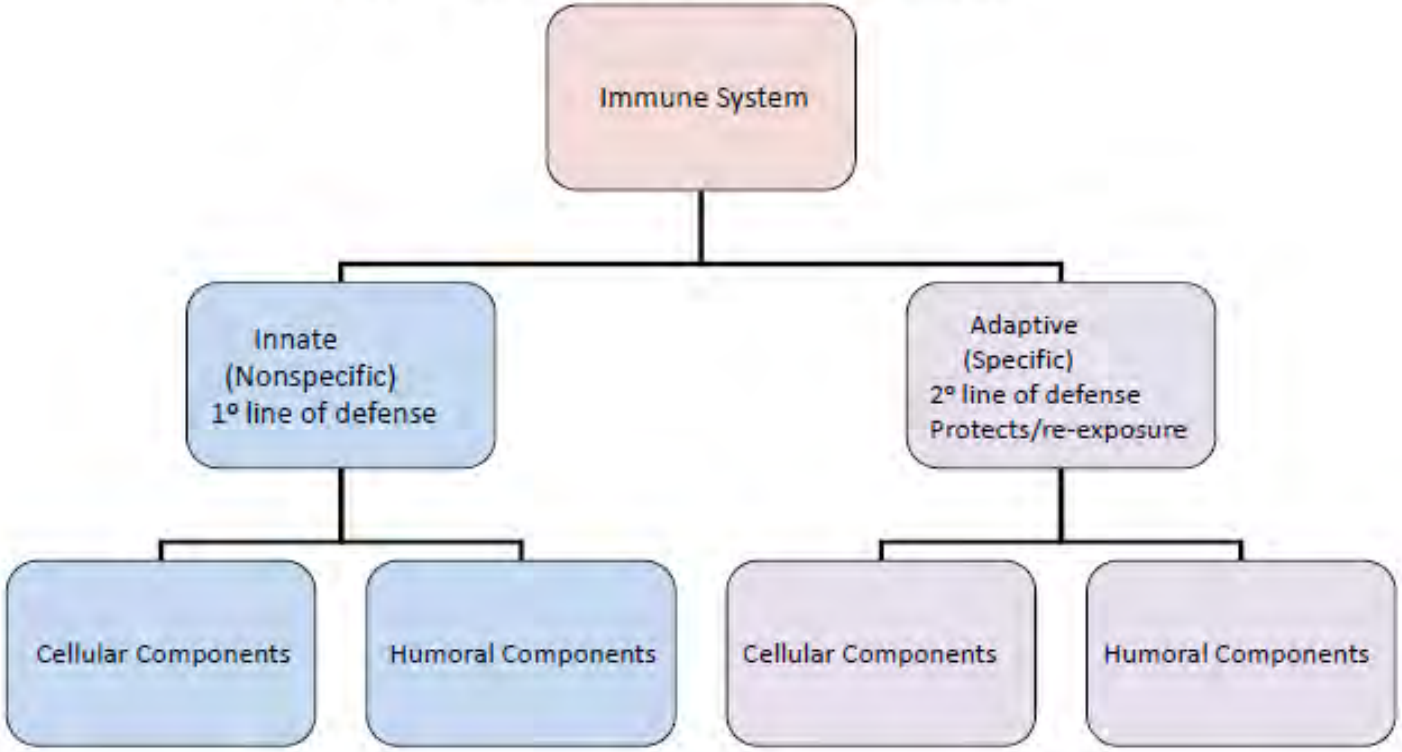
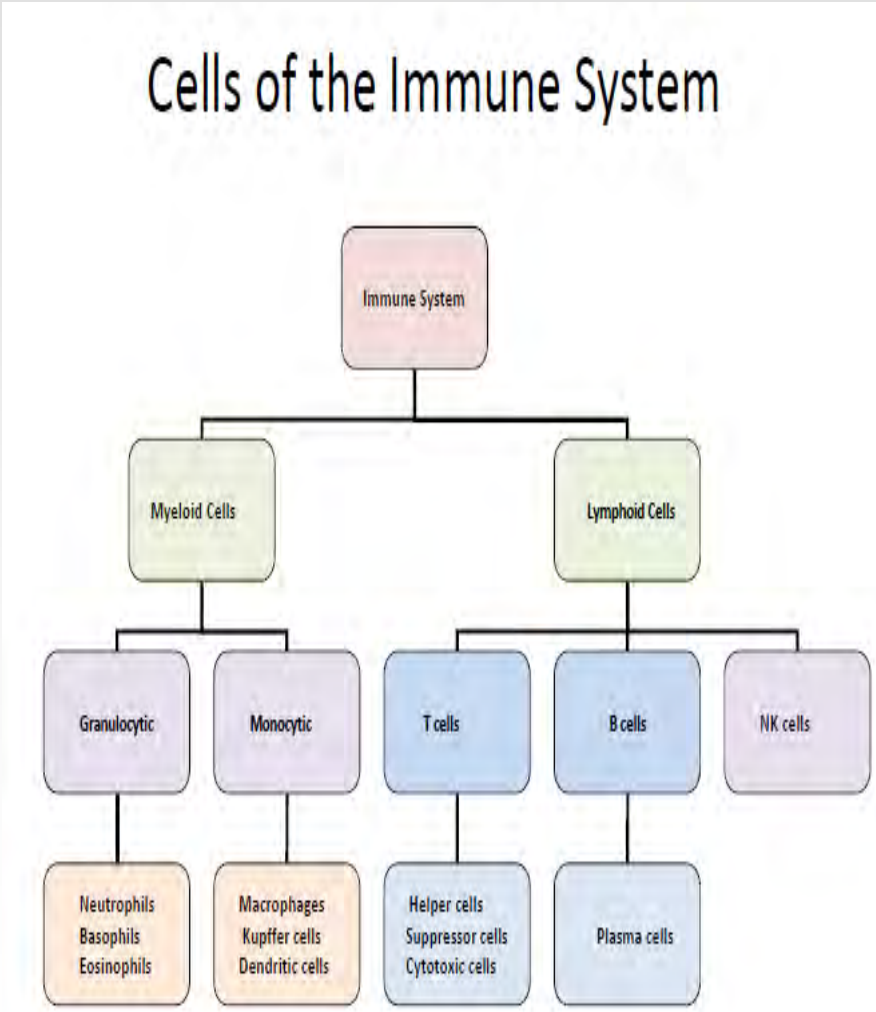
The Immune System

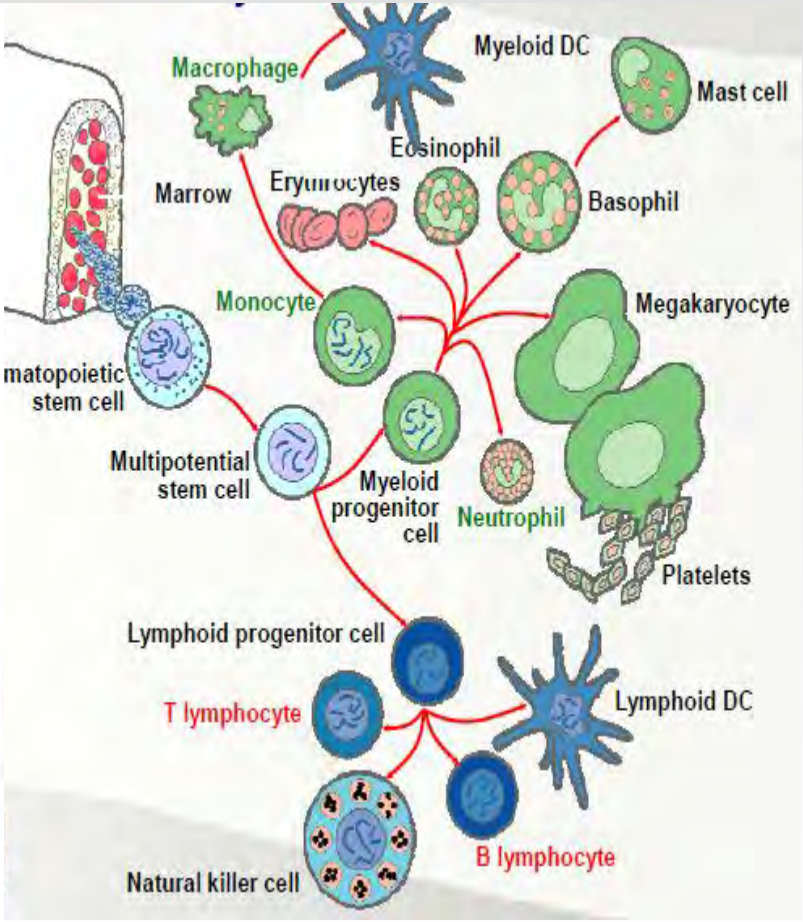


Both systems are interrelated

Santhakumar Manicassamy, Ph.D. & Lisa Butterfield, Ph.D

Cells of Immune System



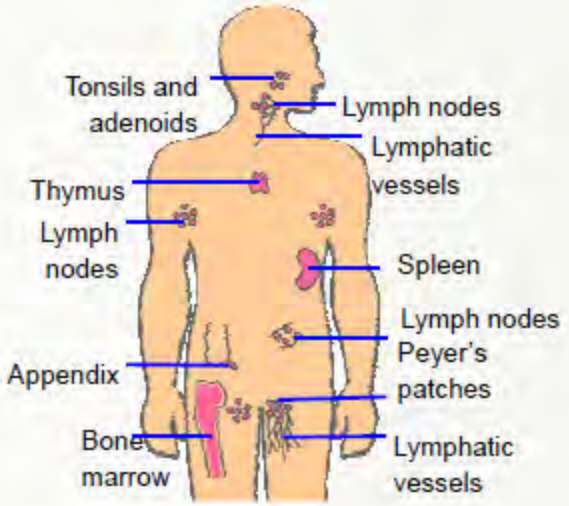


Esteban Celis, M.D., Ph.D; Lisaa Butterfield, Ph.D.

Santhakumar Manicassamy, Ph.D. & Lisa Butterfield, Ph.D

Organs of the Immune System

- Immune system organs are positioned **throughout** the body
- Key organs include the **bone marrow**, the **thymus** and the **spleen**
- Additional lymphoid tissues are found in many parts of the body, especially in the linings of the digestive tract and the airways and lungs--gateways to the body
- These tissues include the tonsils, adenoids, appendix and multiple **lymph nodes**



Esteban Celis, M.D., Ph.D, Lisa Butterfield, Ph.D.

Adaptive Immunity

Adaptive immune responses are acquired and display 4 attributes:

1. Antigen specificity
2. Diversity
3. Immunologic memory
4. Self/non-self recognition

Adaptive Immune System

- Lymphocytes are the **effector** and **regulatory** cells of the adaptive immune system
- These cells display highly diverse receptors for antigen (Ag)
- Each cell expresses receptors for a single Ag (*i.e.*, **respond only to one Ag**)
- Ags are molecules recognized by these receptors, and **elicit a specific immune response only to that Ag**
- Antigen presenting cells (APCs) gather Ags from infected tissues and cancer cells and then go to lymphoid tissues (lymph nodes) to activate naïve T cells
- **Cytokines** and **chemokines** act as soluble messengers between cells of the immune system

Adaptive Immune System

- Adaptive immune responses differ from innate responses in that they exhibit **specificity** and **memory**
  - **Specificity**: ability to recognize and respond to a particular Ag
  - **Memory**: capacity to respond to a second encounter to the same Ag, producing a larger and more rapid response (as compared to the primary Ag exposure)
  - **Memory**: can offer life-time protection and it is the basis for vaccines
- But, adaptive immune responses are much **slower** than innate immune responses

Humoral and Cell-Mediated Immunity

- Adaptive immune responses involve 2 lines of defense: **humoral and cell mediated immunity** (CMI)
  - **Humoral immunity involves B lymphocytes and antibodies (Abs)**
  - Adaptive **CMI involves T lymphocytes**
  - Some **CMI combines Abs and innate immune cells (NK, macrophages)** via Ab-dependent cell cytolysis (ADCC)
- Both B cells and T cells are **derived from precursors in the bone marrow,** that mature in different sites
  - B cells develop in the **bone marrow** and travel to lymphoid tissues, (spleen, lymph nodes) in search of Ag
  - T cells develop and mature in the **thymus** (positive & negative selection) and then migrate to secondary lymphoid organs (lymph nodes & spleen)

Esteban Celis, M.D., Ph.D, Lisa Butterfield, Ph.D.

Components of innate immunity

- Anatomical barriers barriers (skin and mucosal membranes)
- Cellular components (phagocytes, NK cells)
- Humoral components (complement, cytokines)

Santhakumar Manicassamy, Ph.D. & Lisa Butterfield, Ph.D

Cells of innate immunity

(Internal Defenses)

Cell Type	Principal Function (s)
Neutrophils	Phagocytosis, inflammation
Macrophages	Phagocytosis, inflammation, T-cell activation, tissue repair
NK cells	Killing of infected or tumor cells
Eosinophils	Killing of certain parasites
Mast cells	Inflammation
Dendritic cells	Phagocytosis, activation of naive T-cells

Dendritic Cells (DC)

- DCs are the interface between innate and adaptive immunity
- DCs are immature as they circulate waiting to encounter pathogens. At this point, they are highly phagocytic, but not good stimulators of adaptive T cell responses
- Once they are activated, they secrete cytokines to initiate inflammation and then they migrate to lymph nodes and mature
- As mature DCs they are very efficient APCs for T cell stimulation
- Other APCs: macrophages, neutrophils, B-lymphocytes, monocytes.

Santhakumar Manicassamy, Ph.D. & Lisa Butterfield, Ph.D

Innate Immunity

Humoral Components

Component	Mechanism
Complement	Lysis of bacteria and some viruses Opsonin Increase in vascular permeability Recruitment and activation of phagocytic cells
Coagulation system	Increase vascular permeability Recruitment of phagocytic cells B-lysin from platelets – a cationic detergent
Lactoferrin and transferrin	Compete with bacteria for iron
Lysozyme	Breaks down bacterial cell walls
Cytokines	Various effects

Innate Immunity vs Adaptive immunity (properties)

Innate	Adaptive
▪ Antigen-independent	▪Antigen-dependent
▪ Non-specific	▪Highly specific
▪ Immediate (hours)	▪Slower (days)
▪ No memory	▪Memory

Innate and adaptive responses work together

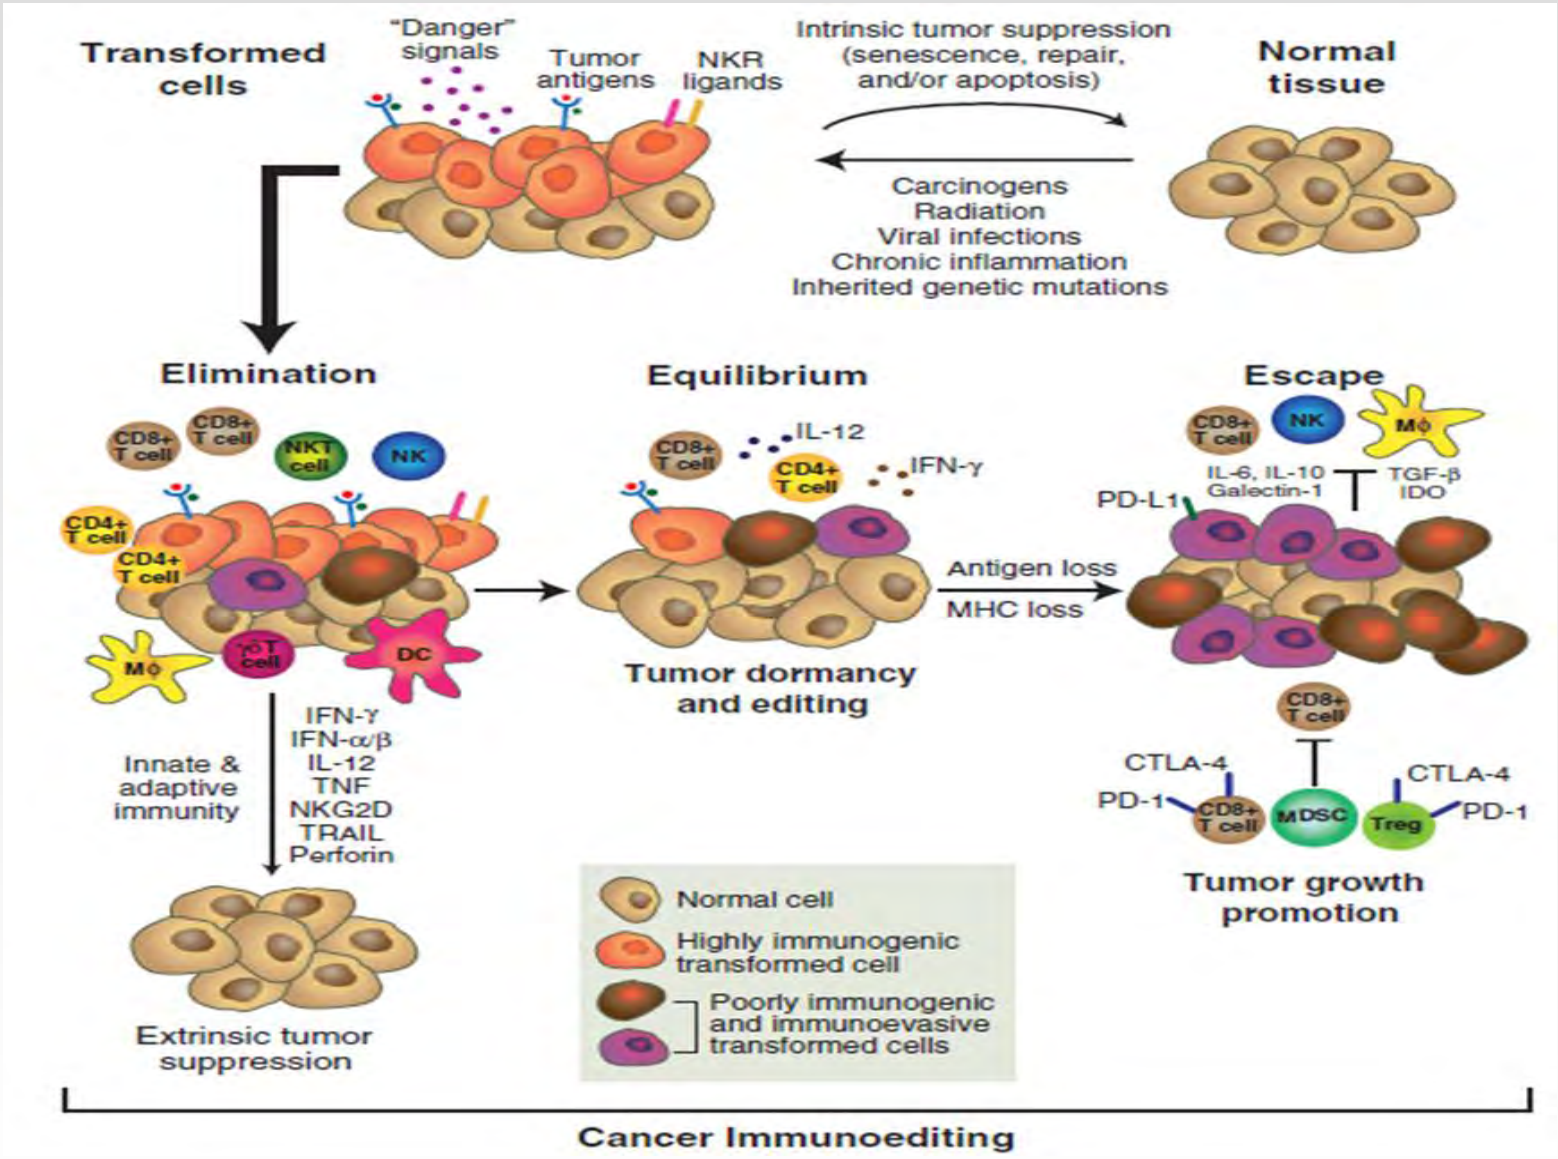
- Innate immune responses activate and shape adaptive immunity
- Adaptive immune responses utilize the machinery of innate immunity for effector function

Santhakumar Manicassamy, Ph.D. & Lisa Butterfield, Ph.D.

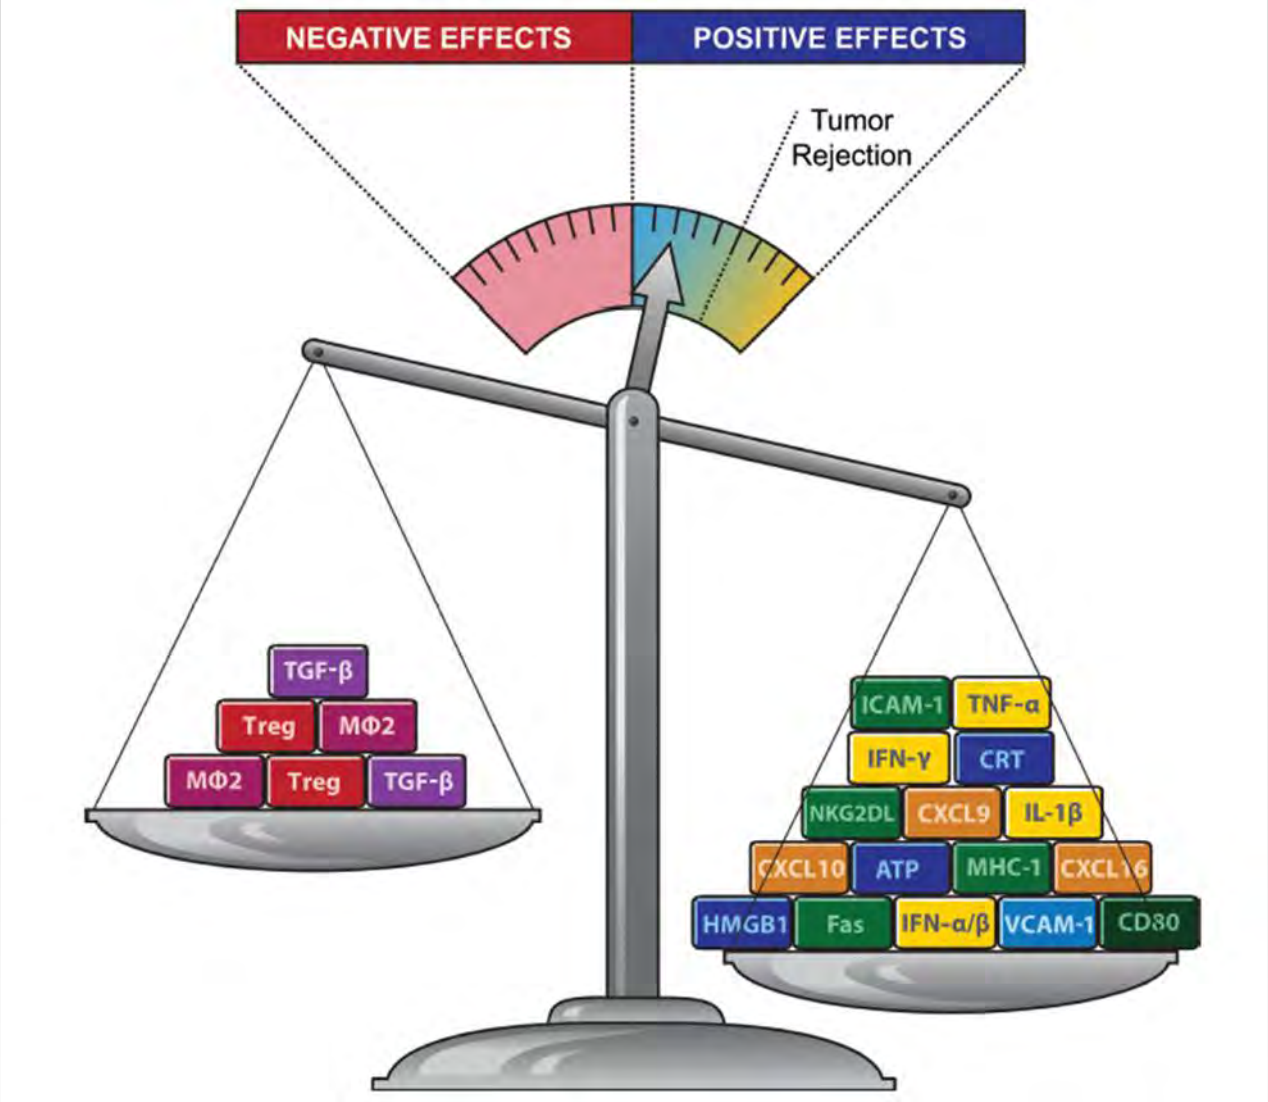
Immune System

Discovery in 2001:

- Immune System not only controls tumor quantity, but also tumor quality (immunogenicity)



Science: 2011:331:25:1565-1570



JNCI: 2013:105:4:256-265

Immunotherapy

- Vaccines
- Immune Modulators
  - Immune Agonists
    - Stimulatory cytokines (IL-2, IL-12, IL-15, TLR etc..)
    - Co-stimulatory molecules (OX-40, GITR, 4-1BB)
  - Immune inhibitors
    - Check point inhibitors (CTLA4, PD1/PDL1, LAG3, TIM3, iDO)
    - Inhibitory cytokines/factors (IL-10, TGFb)

OUTLINE

1. Review of Immune System
2. **Mechanisms of Check Point Inhibitors**
3. Mechanisms of RT cell death

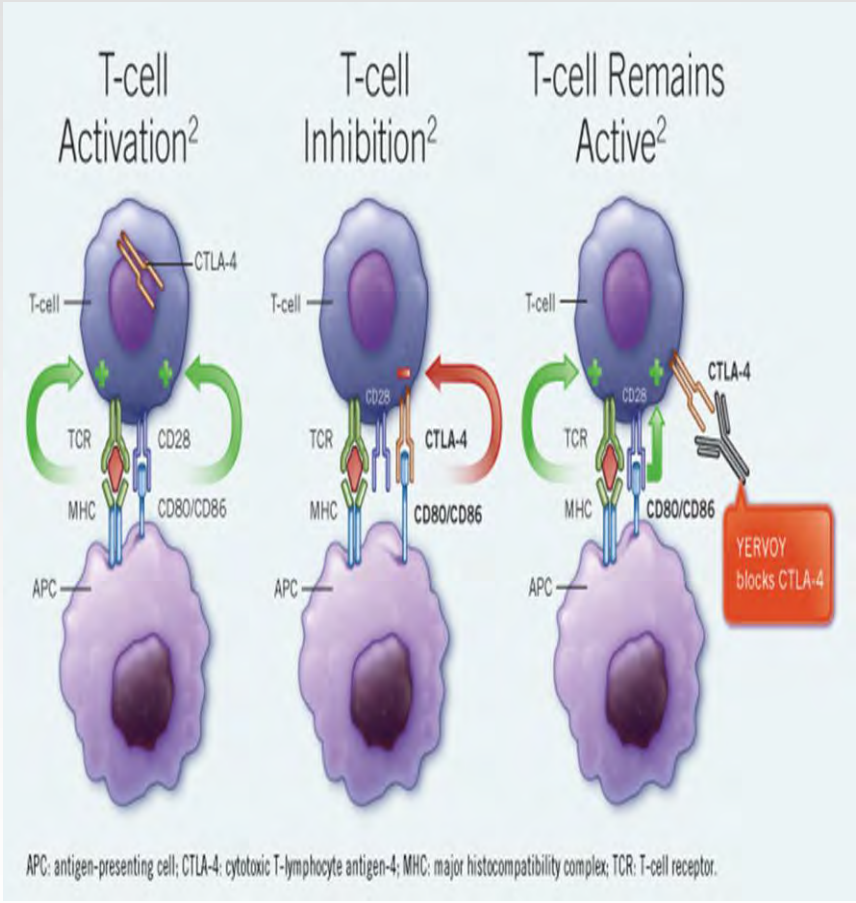
THE OHIO STATE UNIVERSITY JAMES CANCER HOSPITAL AND SOLOVE RESEARCH INSTITUTE®

NCI CCC
A Comprehensive Cancer Center Designated by the National Cancer Institute

Immune Checkpoint Inhibitor Ipilumimab (Yervoy): Blocks CTLA-4

What other mechanisms are there for the activity of CTLA-4 blockade?

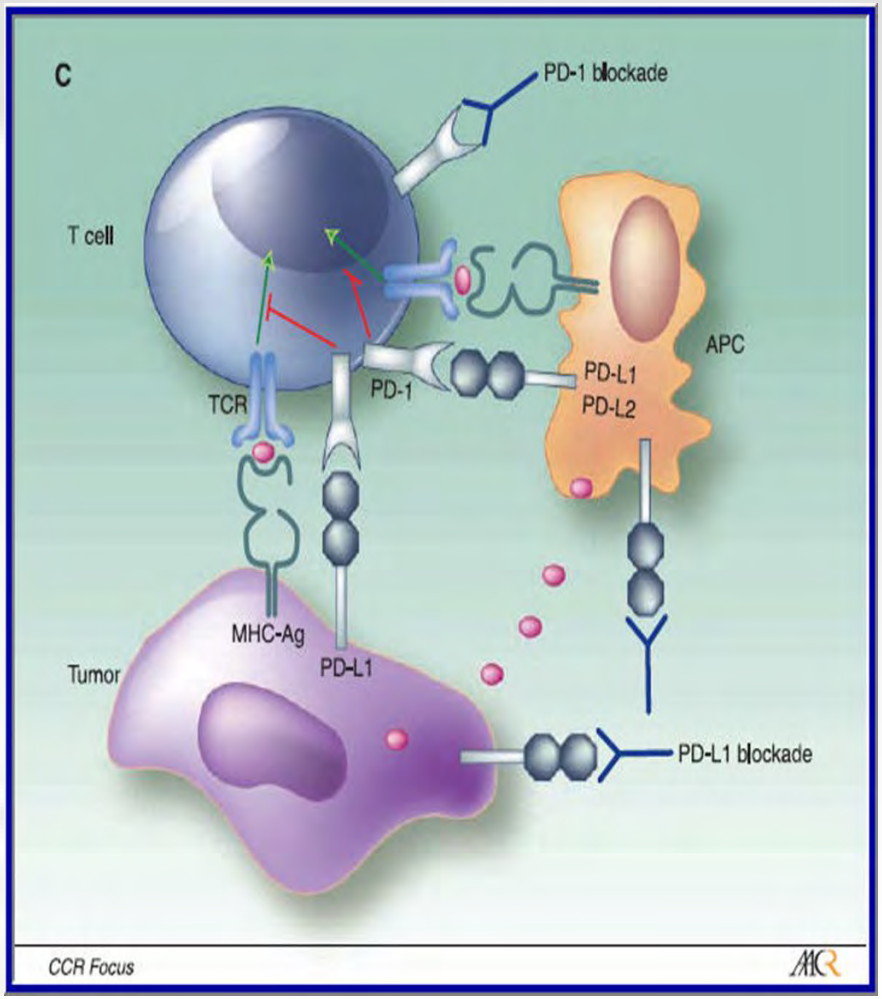
- Ipilimumab is an IgG1 monoclonal antibody
- IgG1 antibodies have ADCC activity
- T regulatory cells express CTLA-4
- Intratumoral depletion of T regulatory cells increases the ratio of Teff to T regulatory cells with enhanced tumor control



Immune Checkpoint Inhibitors
Anti-PD1 & Anti-PDL1

PD-1/PD-L1

- PD-1 inhibits downstream T cell signaling
  - Decreased cytokine production, IL-2 and IFN-γ
  - Decreased Bcl-2
- PD-1 is upregulated on both activated and exhausted T cells
- PD-1 signals through interaction with PD-L1 or PD-L2



Spectrum of PD-1/PD-L1 Antagonist Activity

Active

- Melanoma
- Renal cancer (clear cell and non-clear cell)
- NSCLC – adenocarcinoma and squamous cell
- Small cell lung cancer
- Head and neck cancer
- Gastric and GE junction
- **Mismatch repair deficient tumors**
- Bladder
- Triple negative breast cancer
- Ovarian
- Hepatocellular carcinoma
- Mesothelioma
- Nasopharyngeal Cancer
- Cervical
- **Hodgkin Lymphoma**
- Diffuse large B-cell lymphoma
- Follicular lymphoma
- **Merkel Cell**

Minimal to no activity to single agents:

- Prostate cancer
- Microsatellite Stable Colon cancer
- Multiple Myeloma
- Pancreatic Cancer

Major PD-1/PD-L1 antagonists

- Nivolumab (anti-PD-1)
- Pembrolizumab (anti-PD-1)
- Atezolizumab (MPDL3280A, anti-PD-L1)
- Durvalumab (MEDI-4736, anti-PD-L1)
- Avelumab
- Other PD-1 efforts ongoing from:
  - CureTech/Medivation (CT-011)
  - Sanofi/Regeneron (REGN2810)
  - Novartis (PDR001)
  - Aurigene/Pierre Fabre (AUNP-12)

FDA approval of antibodies targeting immune checkpoints

- 2011 Ipilimumab (BMS) - Melanoma
- 2014 Pembrolizimab (Merck) – Melanoma
- 2014 Nivolumab (BMS) – Melanoma
- 2015 Nivolumab (BMS) – Lung
- 2015 Ipilimumab + Nivolumab (BMS) – Melanoma
- 2015 Pembrolizumab (Merck) – Lung
- 2015 Ipilimumab (BMS) – Adjuvant melanoma
- 2015 Nivolumab (BMS) – Renal cell carcinoma

Number of Open Trials with PD1/PDL1 Agents

- Pembrolizumab: 189
- Nivolumab: 124
- Atezolizumab: 50
- Durvalumab: 15
- Avelumab: 13

Immunotherapy and Radiotherapy

Marka Crittenden, M.D, Ph.D., Lisa Butterfield, Ph.D.

Immunotherapy and Radiotherapy

Preservation of immune cells with hypofractionation

- Neoadjuvant chemoradiation incorporating conventionally fractionated radiation results in prolonged systemic lymphopenia
- Hypofractionation preserves systemic immune cells so may be a better partner for immunotherapy
- Mice don't model this phenomenon, even when accounting for differences in thymic output

Immunotherapy and Radiation

Outstanding Questions

- What radiation dose and fractionation is best to combined with immunotherapy?
- What is the optimal sequencing and timing of radiation and immunotherapy?
- How do we best address the immune suppression that is associated with radiation?

THANK YOU !

INCLUDING INTRAOPERATIVE RADIOTHERAPY IN THE THERAPEUTIC SCHEME RESULTS IN SIMILAR LOCAL CONTROL IN HIGH AND LOW RISK SARCOMA

E.BOLDO, T.PIQUERES, A.MAYOL, R. LOZOYA, A.BOUCHE, V.MORILLO, J.SANCHEZ, C.FERRER

CONSORCIO HOSPITALARIO PROVINCIAL DE CASTELLON (SPAIN)

INTRODUCTION

Table 1
Prognostic factors in soft tissue sarcoma[a]

Local recurrence	Post metastasis survival	Distant recurrence	Disease-specific survival
Local recurrence at presentation	Size > 10 cm	High grade	High grade
Positive margins		Size > 5 cm	Size > 10 cm
Fibrosarcoma		Size > 10 cm	Deep location
Age > 50		Deep location	Positive margins
		Local recurrence at presentation	Local recurrence at presentation
			Lower extremity site

[a] Adapted from: Pisters P, Leung D, Woodruff J, Shi W, Brennan MF. Analysis of prognostic factors in 1,041 patients with localized soft tissue sarcomas of the extremity. *J Clin Oncol* 1996;14(5):1679–89.

Brenann MF, International Journal of Surgery, 2013

OBJECTIVE

- TO COMPARE THE LOCAL CONTROL OBTAINED IN HIGH AND LOW RISK SARCOMAS WHEN INTRAOPERATIVE RADIOTHERAPY IS ADDED TO THERAPEUTIC SCHEME (SURGERY WITH OR WHITOUT EXTERNAL RADIOTHERAPY)

PATIENTS AND METHODS

- IOERT DATABASE
- PROTOCOL: DEMOGRAPHICAL AND ONCOLOGICAL DATA.
- ASSOCIATION BETWEEN LOCAL CONTROL AND RISK FACTORS PRESENCE (FISHER´S EXACT TEST AND KAPLAN-MEIER CURVE)
  - HIGH GRADE VS LOW GRADE
  - SIZE >5 CM VS < 5CM
  - DEEP VS SUPERFICIAL LOCATION
  - LOCAL RECURRENCE AT PRESENTATION VS PRIMARY
  - POSITIVE VS NEGATIVE MARGINS
  - AGE >50 VS < 50 YEARS OLD
  - FIBROSARCOMA VS OTHER HISTOLOGY TYPES.

RESULTS

- IORT DATABASE: 114 CASES
- 26 STS
  - EXTREMITY: 17
  - RETROPERITONEAL 4
  - TRUNK: 5
- THERAPEUTIC SCHEME: SURGERY, IORT AND, EXCEPT IN 4 (15%) , EXTERNAL RADIOTHERAPY.

RESULTS

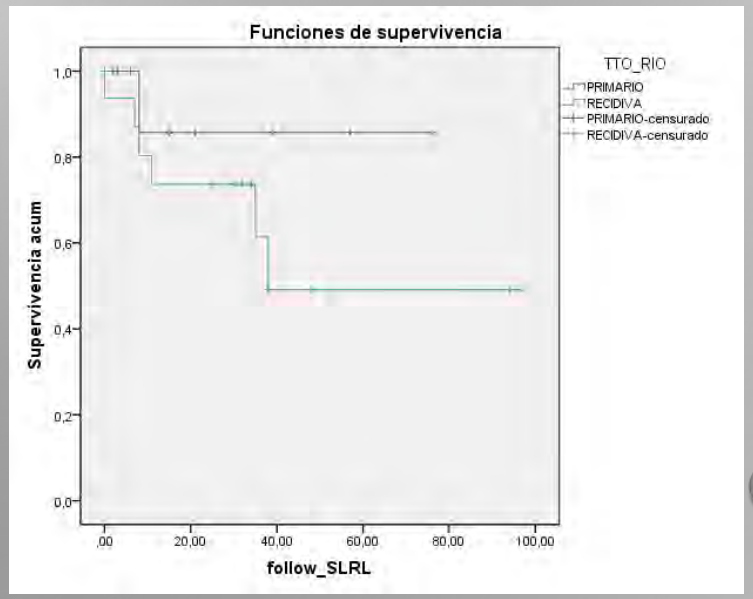
- GRADE
  - HIGH: 8
  - INTERMEDIATE: 5
  - LOW: 13
- SIZE WAS > 5 CM IN 15 CASES (57.6%).
- LOCATION WAS DEEP IN 18 CASES (69.2%).
- LOCAL RECURRENCE AT PRESENTATION WAS PRESENT IN 8 CASES (30%).
- POSITIVE MARGINS WERE FOUND IN 2 CASES (7%).

RESULTS

- PATIENTS WERE >50 YEARS OLD IN 18 CASES (69.2%).
- SARCOMA TYPE:
  - FIBROSARCOMA: 5
  - LIPOSARCOMAS: 8
  - LEIOMIOSARCOMAS: 5
  - SYNOVIAL SARCOMA: 1
  - OTHER : 7
- LOCAL CONTROL: 20 CASES (76.9%) , COULD NOT BE DETERMINED IN 2.

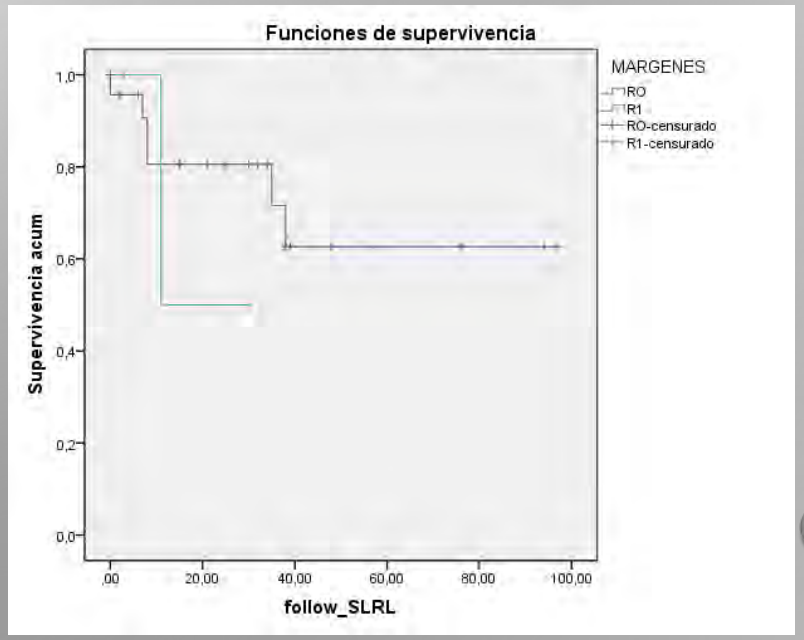
RESULTS-PRIMARY VS RELAPSE

- FET
  - P=0.29
- KMC



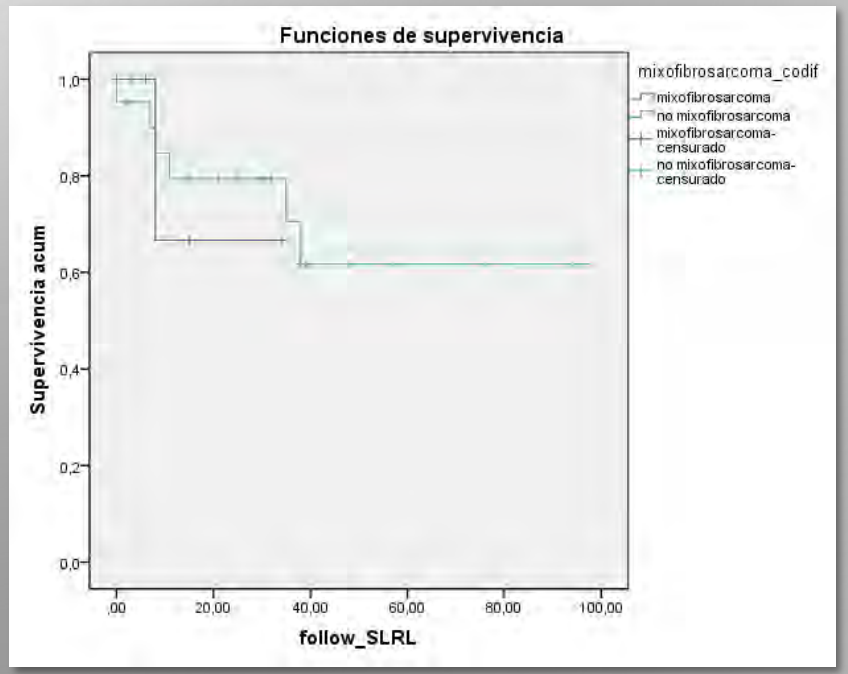
RESULTS- R1 VS R0

- FET
  - P=0.33
- KMC



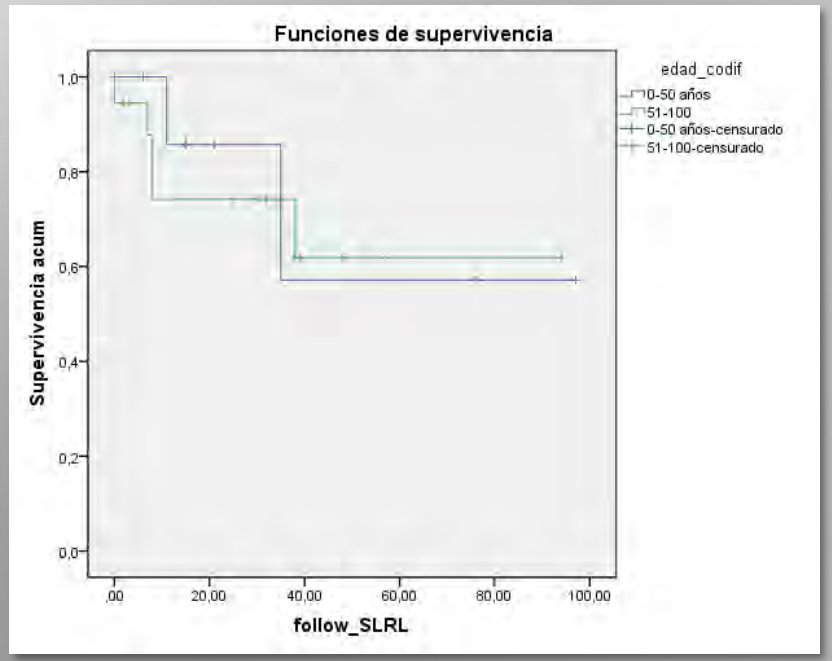
RESULTS FIBROSARCOMA VS OTHER

- FET
  - P=1.0
- KMC



RESULTS AGE > 50 VS < 50

- FET:
  - P=1.0
- KMC

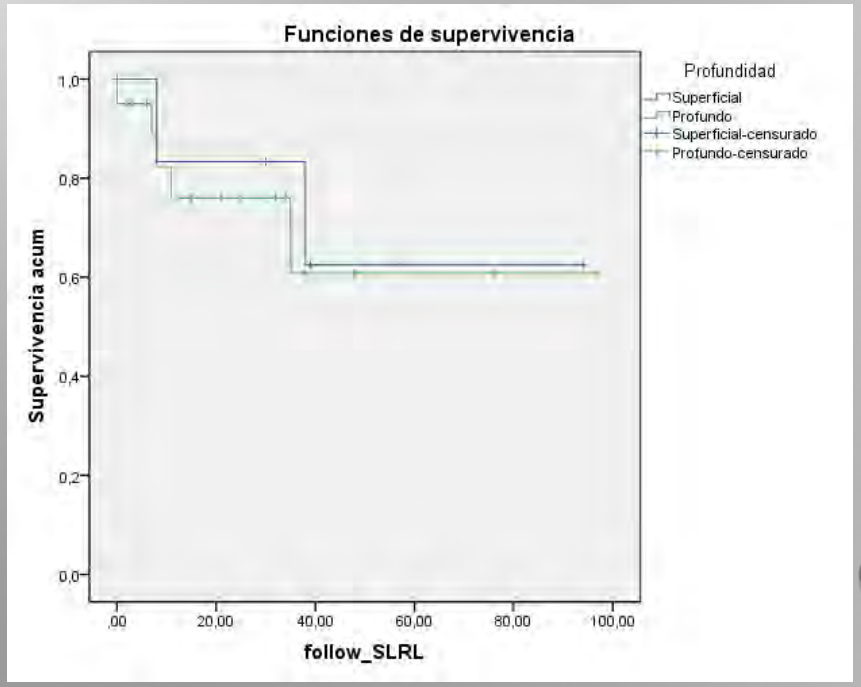


RESULTS-HIGH VS LOW GRADE

- FET:
  - P=0.52
- KMC

RESULTS- DEEP VS SUPERFICIAL

- FET
  - P=0.43
- KMC



RESULTS-SIZE>5 CM VS <5CM

- FET
  - P=0.11
- KMC

CONCLUSION

- IN OUR EARLY EXPERIENCE, WHEN INTEGRATEING IORT IN THE STANDARD THERAPEUTIC SCHEME (SURGERY AND EXTERNAL RADIOTHERAPY), THE PRESENCE OF LOCAL RELAPSE RISK FACTORS SEEMS NOT TO INFLUENCE LOCAL CONTROL ACHIEVEMENT IN STS.

INTRAOPERATIVE RADIOTHERAPY AND VASCULAR RESECTION

Introduction

"Intraoperative doses up to 20 Gy appear to contribute minimally to late graft occlusion, while doses > or = 25 Gy contribute to late occlusion with high likelihood. Both intraoperative dose and total radiotherapy dose correlated with late graft occlusion, and with histopathologic changes in the graft and anastomoses"

Johnstone PA, Sprague M, DeLuca AM, Bacher JD, Hampshire VA, Terrill RE, Kinsella TJ, Sindelar WF Effects of intraoperative radiotherapy on vascular grafts in a canine model. Int J Radiat Oncol Biol Phys. 1994 Jul 30;29(5):1015-25

Introduction

CIA, common iliac artery; CIV, common iliac vein; EIA, external iliac artery; EIV, external iliac vein; IVC, inferior vena cava; SFA, superficial femoral artery; SMA, superior mesenteric artery; SMV, superior mesenteric vein.

Monnagam et al. Ann Vasc Surg, 2015

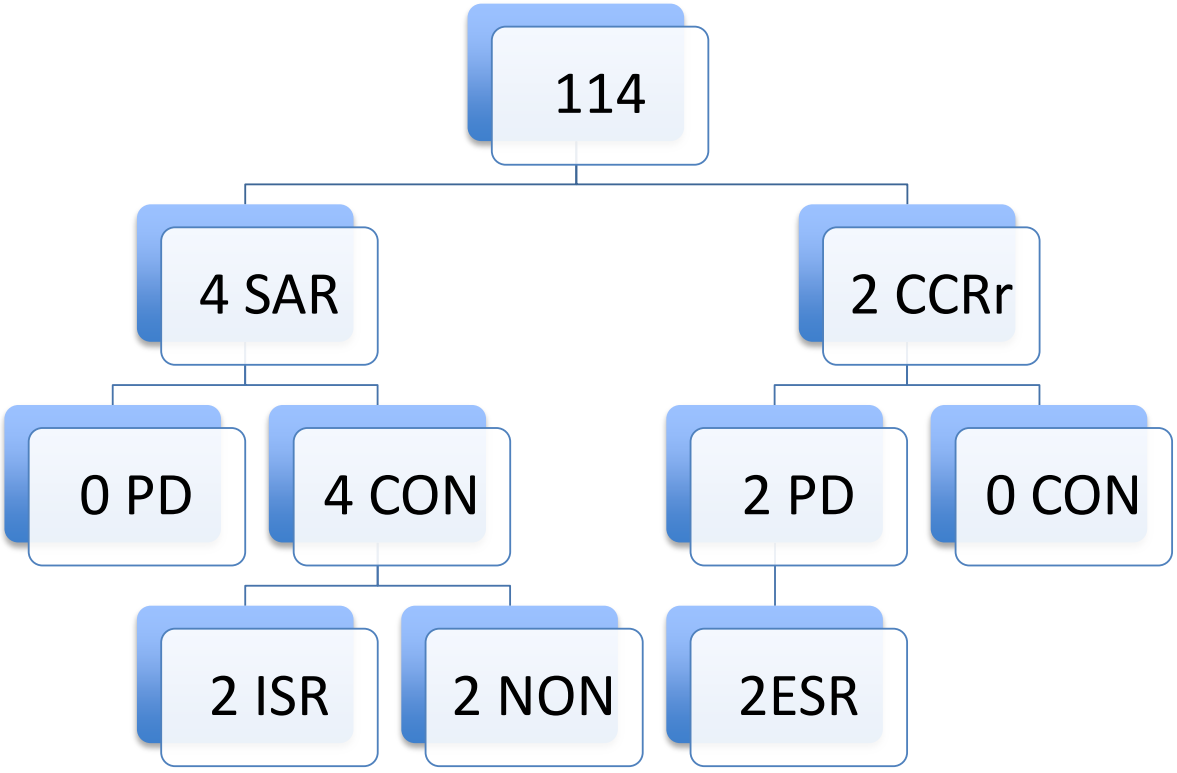
Objective

Report our experience in IORT in tumors requiring vascular resections, specialy in relation with the reconstruction strategies used.

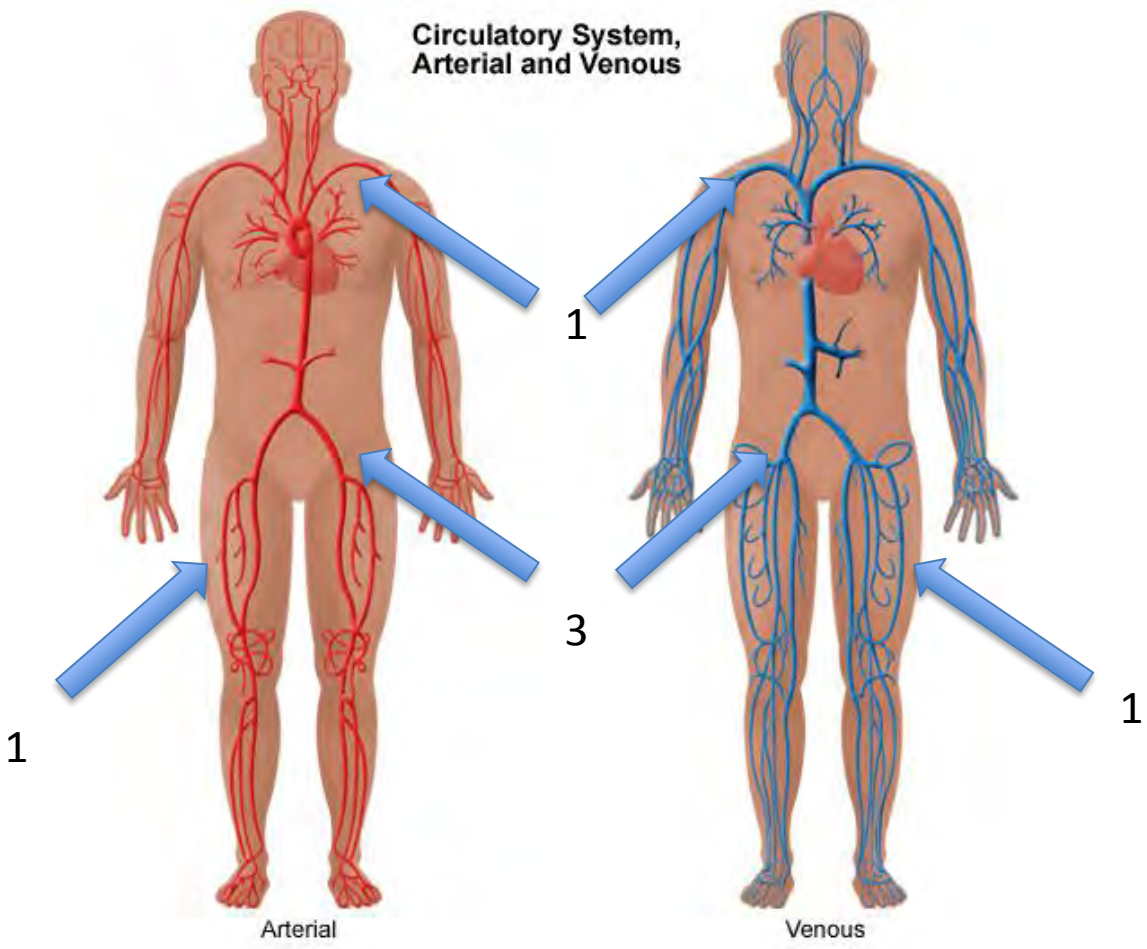
Patients and Methods

- IORT database
- Protocol:
  - Oncological data
  - Vascular data:
    - Type of resection (A/ AV/ V)
    - Location resected vessel/s
    - Timing vascular resection-IORT (PD/CON)
    - Type of vascular reconstruction (in/ex/none)
  - Margins, Dose, Op. time, Infectious complications
- Association Timing/I.Complications: Fisher´s Exact Test

Results



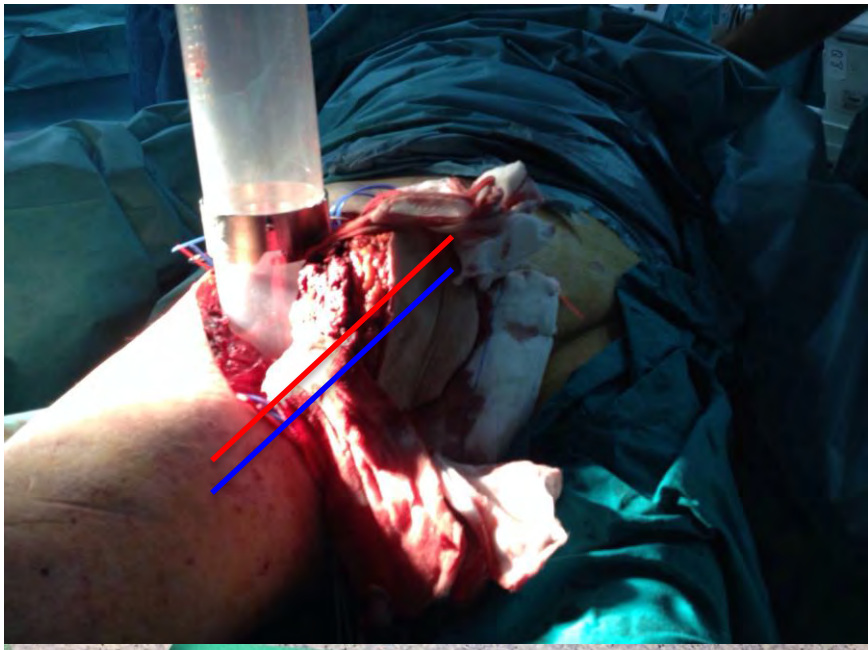
Results



Circulatory System,
Arterial and Venous
1
3
1
1
Arterial
Venous

Results

- IO Dose: 12-17 Gy
- Mean Operative Time: COM 2h> PD
- Resection Margins+: 2/6
- Infectious complications
  - PD (ESR): 0%
  - CON (ISR/NON): 75%
  - FET:
    - P=0.40



Conclusion

- In our initial experience, the strategy of *ex situ* vascular reconstruction performed the days previous to IORT reduce operative time but not infectious complications nor the need to reduce dose in cases requiring vascular resection.

Hospital General Universitario Gregorio Marañón
SaludMadrid
Comunidad de Madrid

9th International ISIORT Conference

Conclusions

The development of post-neoadjuvant RAPA is a **frequent and heterogeneous follow-up event.**

Risk factors predictive of presacral radiological alteration includes: **prolonged surgery (>5 hours), the presence of pro-inflammatory events in the presacral area and radioresistant post-neoadjuvant nodes.**

In clinical practice **post-neoadjuvant RAPA** is **rarely rectal cancer recurrence (4%).**

INTRODUCTION

NCCN National Comprehensive Cancer Network®

NCCN Guidelines Version 3.2015
Rectal Cancer

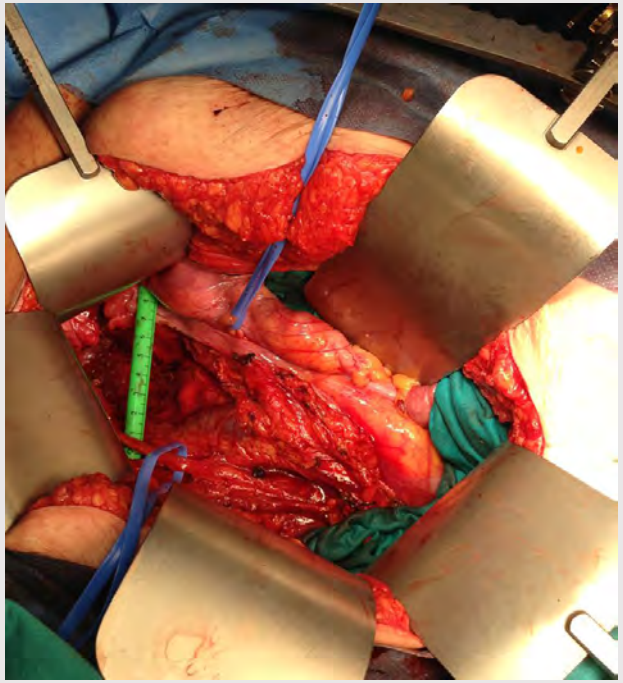
NCCN Guidelines Index
Rectal Cancer Table of Contents
Discussion

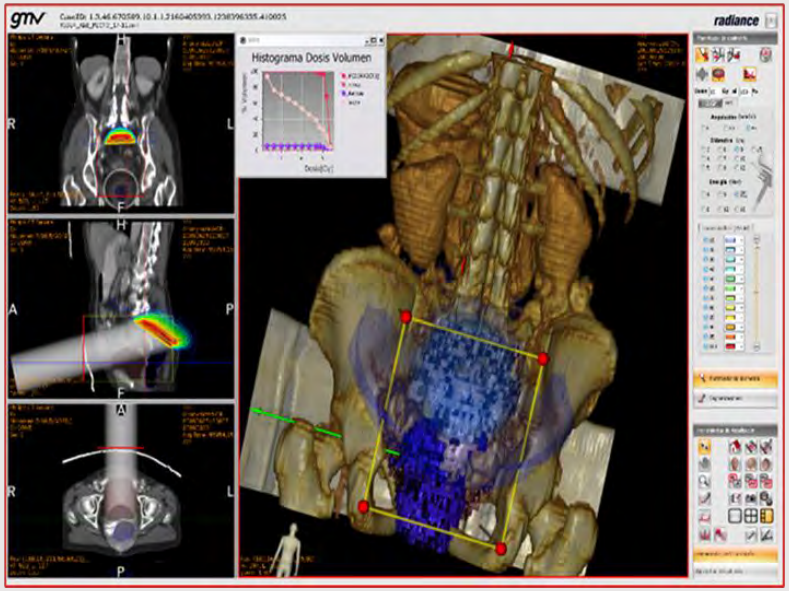
PRINCIPLES OF RADIATION THERAPY

- Radiation therapy fields should include the tumor or tumor bed, with a 2–5 cm margin, the presacral nodes, and the internal iliac nodes. The external iliac nodes should also be included for T4 tumors involving anterior structures.
- Multiple radiation therapy fields should be used (generally a 3- or 4-field technique). Positioning and other techniques to minimize the volume of small bowel in the fields should be encouraged.
- For postoperative patients treated by abdominoperineal resection, the perineal wound should be included within the fields.
- Intensity-modulated radiation therapy (IMRT) should only be used in the setting of a clinical trial or in unique clinical situations including re-irradiation of recurrent disease after previous radiotherapy.
- Radiation doses:
  - 45–50 Gy in 25–28 fractions to the pelvis.
  - For resectable cancers, after 45 Gy a tumor bed boost with a 2-cm margin of 5.4 Gy in 3 fractions could be considered for preoperative radiation and 5.4–9.0 Gy in 3–5 fractions for postoperative radiation.
  - Small bowel dose should be limited to 45 Gy.
- Intraoperative radiation therapy (IORT), if available, should be considered for very close or positive margins after resection, as an additional boost, especially for patients with T4 or recurrent cancers. If IORT is not available, 10–20 Gy external beam radiation and/or brachytherapy to a limited volume could be considered soon after surgery, prior to adjuvant chemotherapy.
- For unresectable cancers, doses higher than 54 Gy may be required, if technically feasible.

AIMS

- Assessment of toxicity and survival of intra-operative radiotherapy as a boost in presacral area





MATERIALS AND METHODS I

- Retrospective study (December 2008 - March 2016)
  - 19 LARC patients
  - 52.6% were women and 47.4% men
  - Median 56.26 years (range 31-73)
- Classification according to the stage

Stage

	Frequency	Valid Percentage
II	1	5,3
III	17	89,5
IV	1	5,3
Total	19	100,0

- 84.2% received concurrent chemotherapy

MATERIALS AND METHODS II

- Though 94,7% showed free surgical margin (R0)
  - 16.7% showed lymphatic and perineural invasion respectively (5.6 y 11.1%).
- The dose varies according to the intention and the surgical margin

Applicator diameter

INTRAOPERATIVE RADIOTHERAPY WITH ELECTRONS AND SURGERY IN PELVIC RECURRENCE: RESULTS OF OUR INSTITUTION

ID-009

Morillo V, López J, Bouché A, Ferrer C, Boldó E, Lozoya R, Mayol A

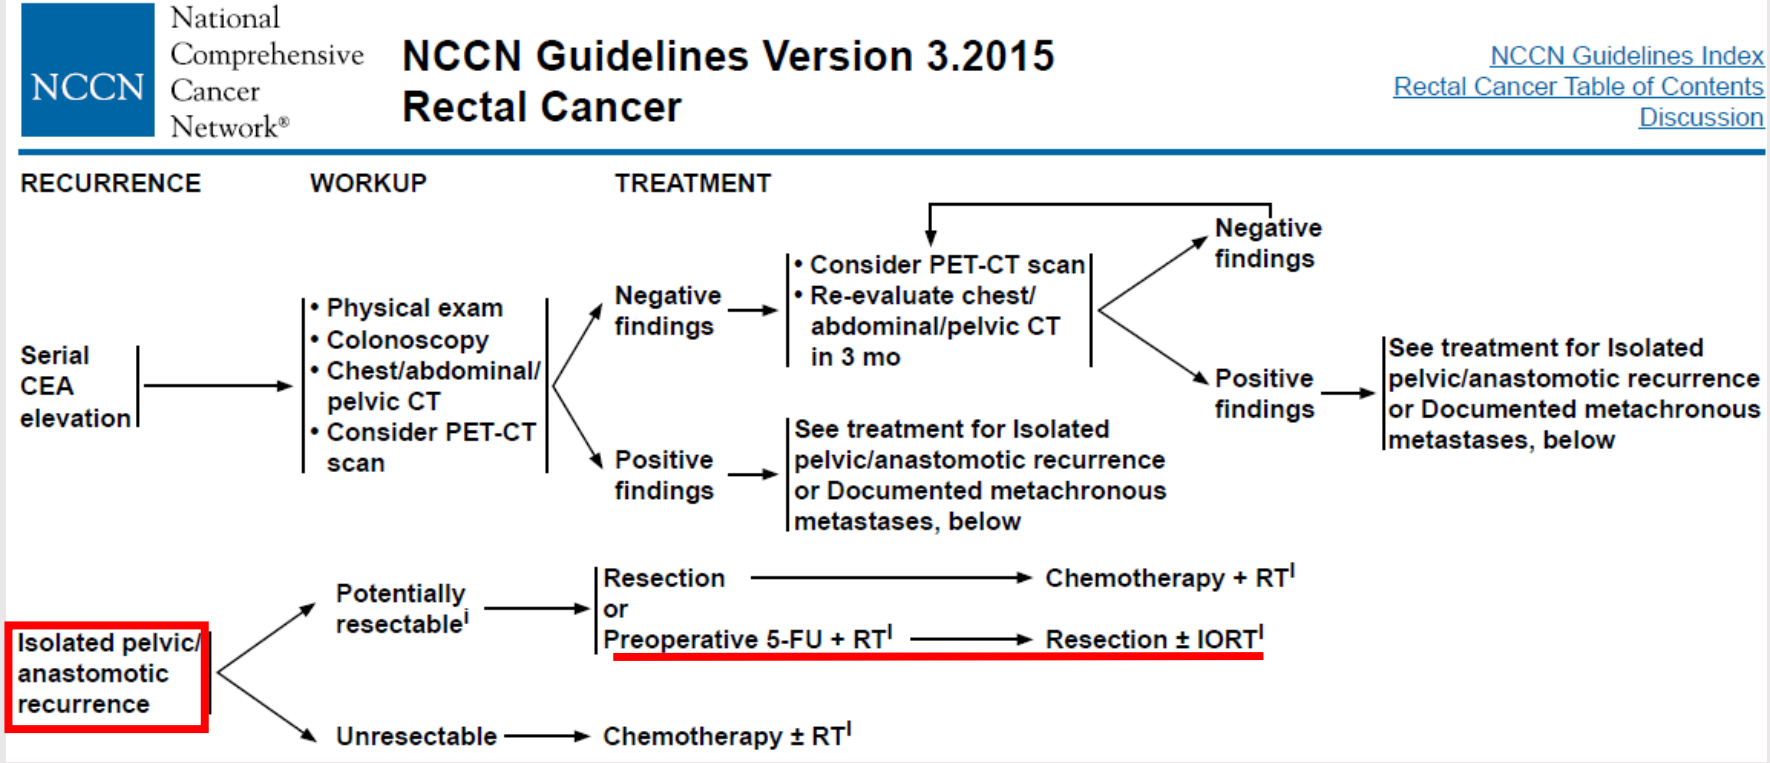
Consorcio Hospitalario Provincial de Castellón

Fundación Hospital Provincial Castellón

INDEX

INTRODUCTION

- The percentage of local relapse after radical treatment in rectal neoplasias is around 25%.
  - 15% die without distant disease and median survival without treatment is around 8 months.



AIMS

- Assessment of rectal recurrence treated with surgery plus IOERT in our institution
  - In terms of:
    - ✓ Locorregional control
    - ✓ Toxicity

MATERIALS AND METHODS I

- Retrospective study (December 2008 - March 2016)
  - 19 rectal recurrence patients
  - 63,2% were men and 36,8% women
  - Median 63,37 years (range 45-82)

PS (PERFORMANCE STATUS)

	Frequency	Valid Percentage
PS 0	5	26,3
PS 1	10	52,6
PS 2	4	21,1
Total	19	100,0

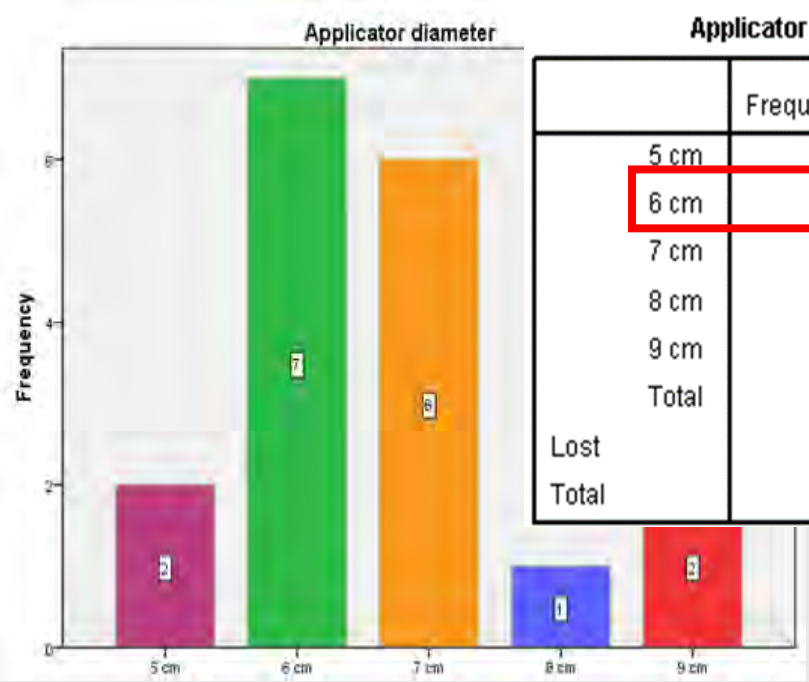
RADIOTHERAPY PREOPERATIVE (RT)

	Frequency	Valid Percentage
Yes	15	78,9
No	4	21,1
Total	19	100,0

	Frequency	Valid Percentage
radical	14	73,7
paliativa	5	26,3
Total	19	100,0

MATERIALS AND METHODS II

- The treatment volume was defined by tumor size plus a margin that contains the area at risk; marked with surgical clips for a correct display.
- The applicator size most frequently used (38,9 %) was 6 cm. The energy of electrons predominance being used 9 Mev (52.6%), range 9-15 MeV.



Applicator diameter

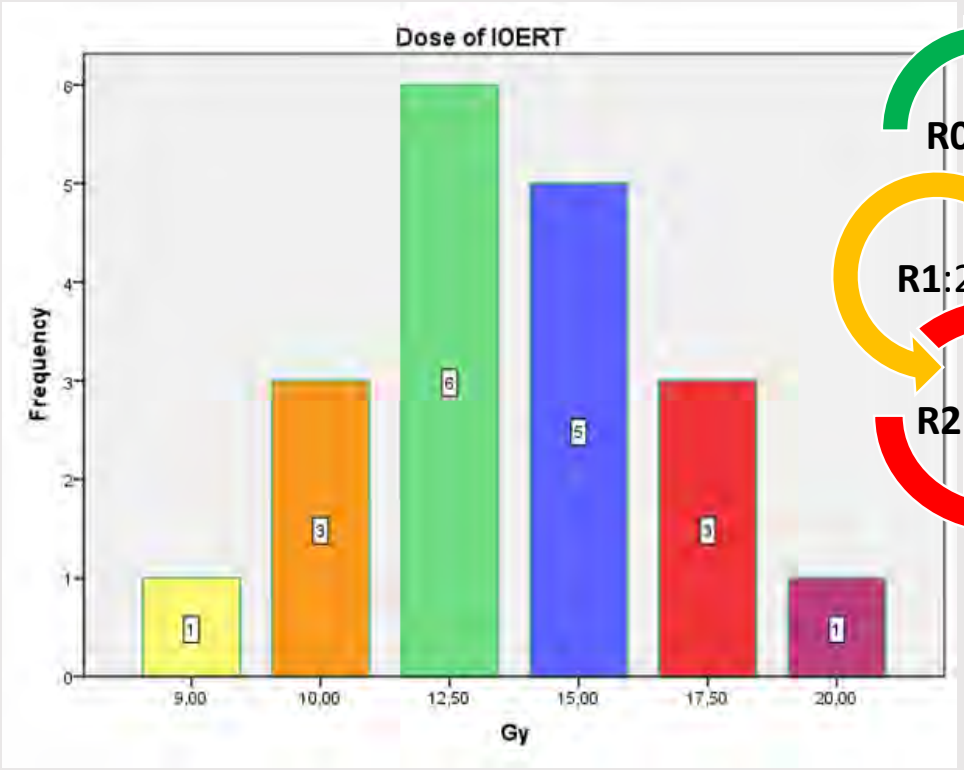
		Frequency	Valid Percentage
	5 cm	2	11,1
	6 cm	7	38,9
	7 cm	6	33,3
	8 cm	1	5,6
	9 cm	2	11,1
	Total	18	100,0
Lost		1	
Total		19	

Energy of electrons

	Frequency	Valid Percentage
6	1	5,3
9	10	52,6
12	5	26,3
15	3	15,8
Total	19	100,0

MATERIALS AND METHODS III

- The IOERT dose varies according to the surgical margin: RO, R1, and R2 with 9-12.5(52.7%),15(26.3%) and 17.5-20 (21.1%) respectively.
- Assessment of toxicity according to RTOG scale.



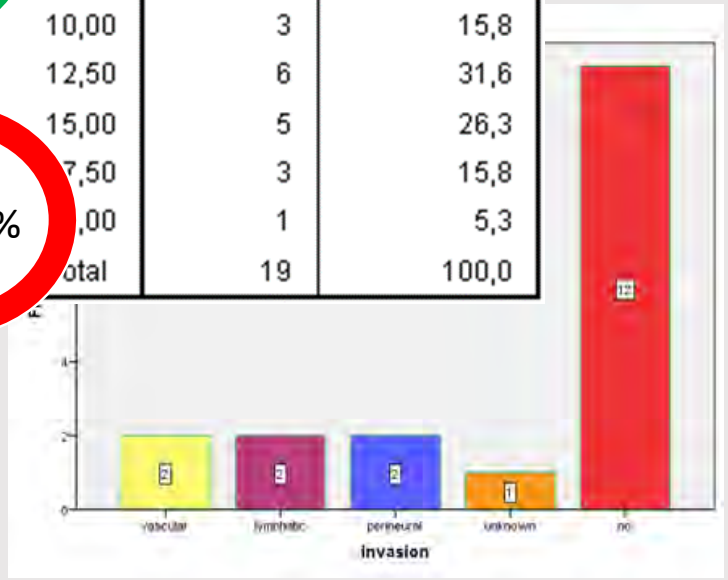
R0:52.7%

R1:26.3%

R2:21.1%

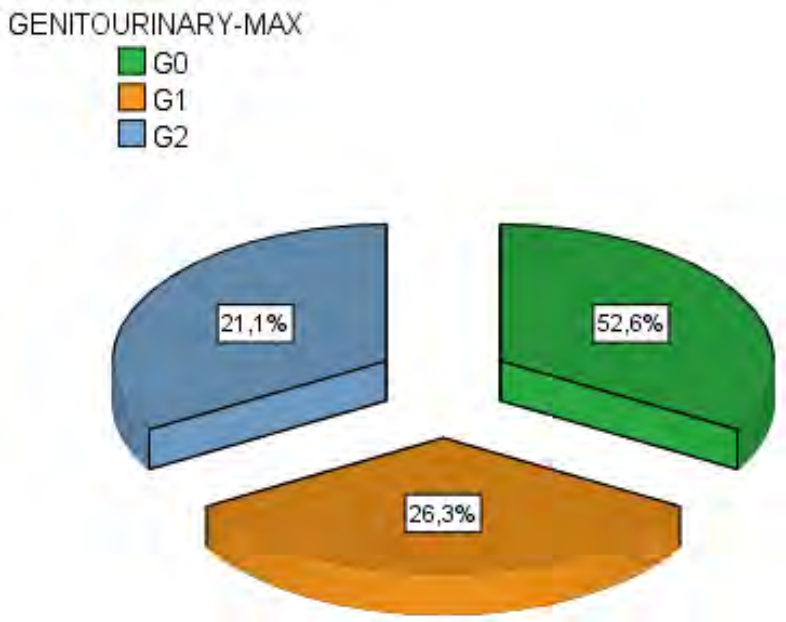
Total dose IOERT

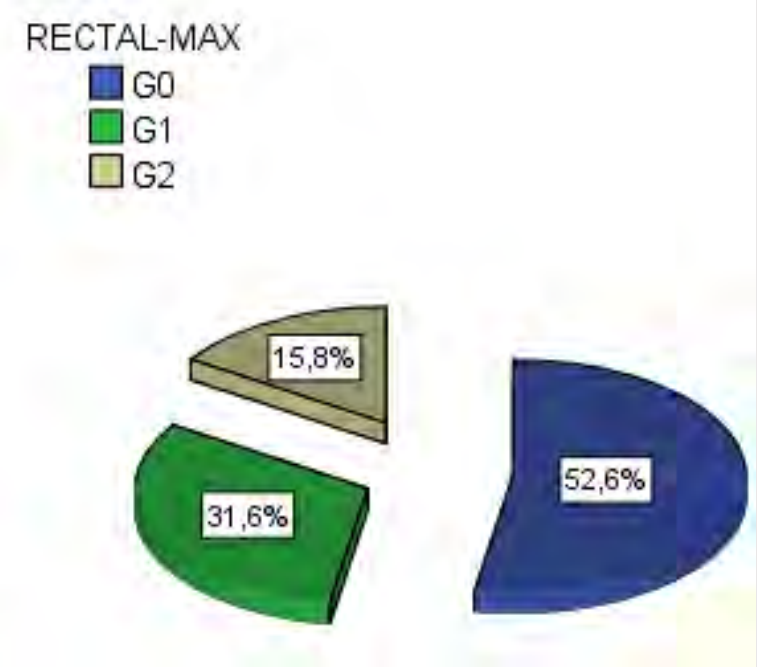
	Frequency	Valid Percentage
9,00	1	5,3
10,00	3	15,8
12,50	6	31,6
15,00	5	26,3
,50	3	15,8
,00	1	5,3
otal	19	100,0



RESULT I

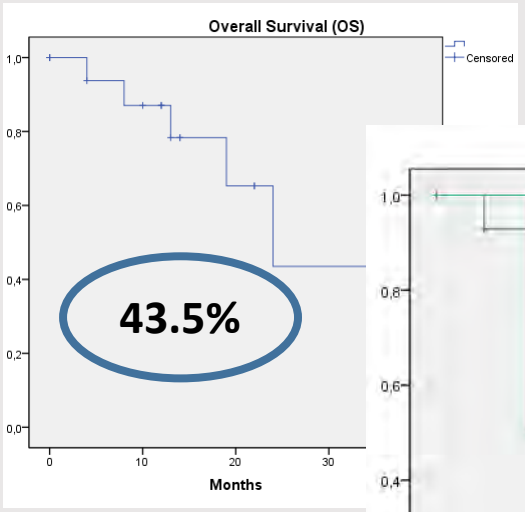
- As for maximum acute toxicity was: grade II rectal 15.8%, moderate neuropathic pain 22.2% and genitourinary in 21.1 %.
- There was no subsequent late toxicity.

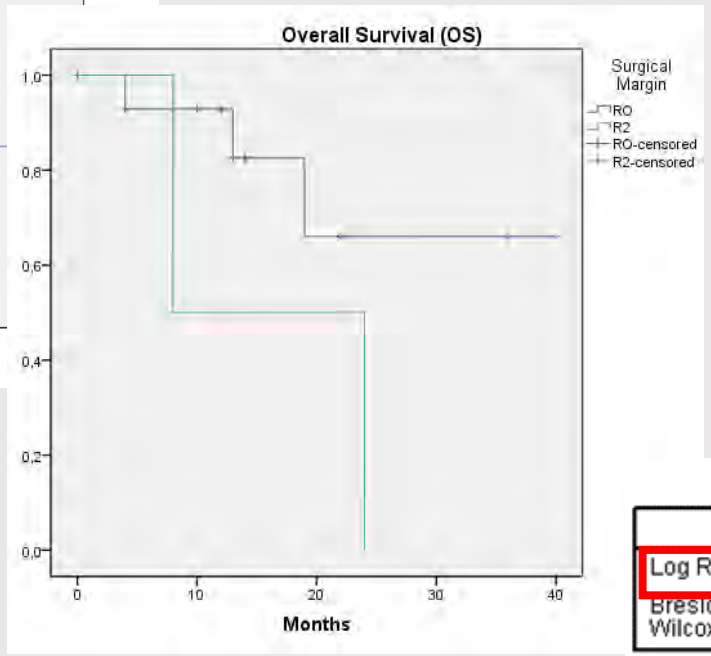




RESULT II

- With a median follow-up of 49 months, the current overall survival of 43.5% is not statistically significant (p = 0.171) vs R0 vs R2.





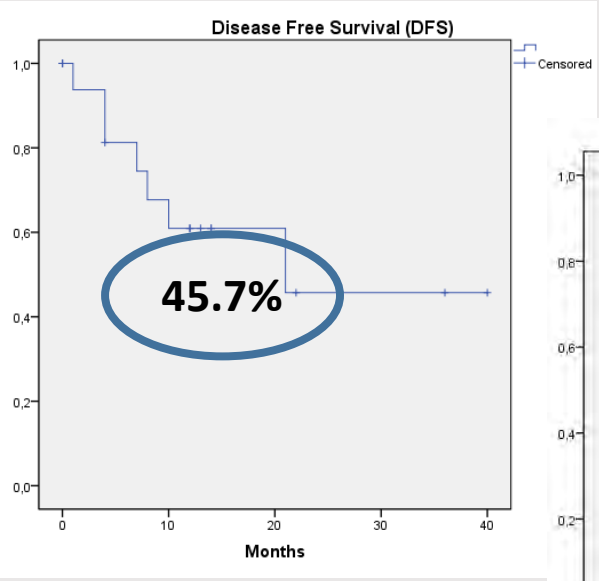
Margin	N° total	N° of events	Censored	
			N°	Percentage
R0	16	3	13	81,3%
R2	3	2	1	33,3%
Global	19	5	14	73,7%

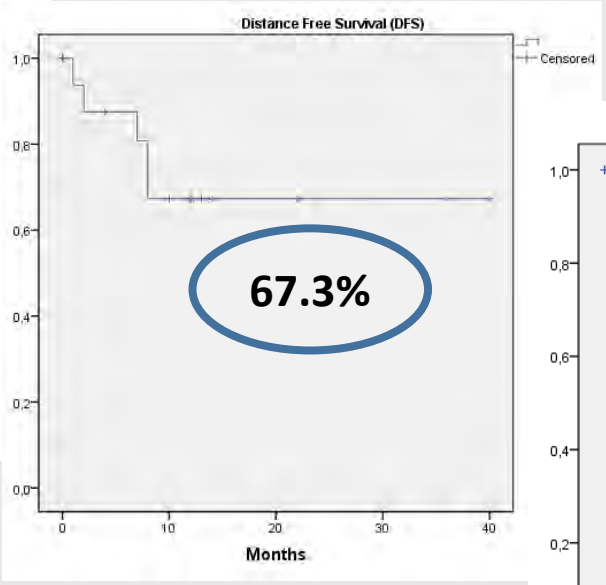
Global comparation

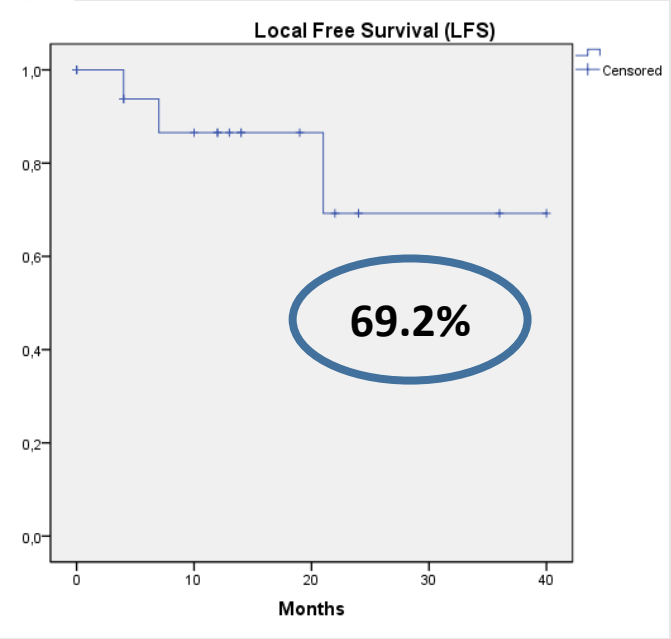
	Chi-cuadrado	gl	Sig.
Log Rank (Mantel-Cox)	1,877	1	,171
Breslow (Generalized Wilcoxon)	1,471	1	,225

RESULT III

- The disease-free survival, distant and local control is about 45.7 %, 67,3% and 69.2% respectively. The dominant pattern of distant relapse: liver and lung.







CONCLUSION

- The use of IOERT in treatment of recurrent rectal can significantly improve local control without increasing the incidence and severity of toxicity.
- Both individualized strategies and longer follow-up are needed

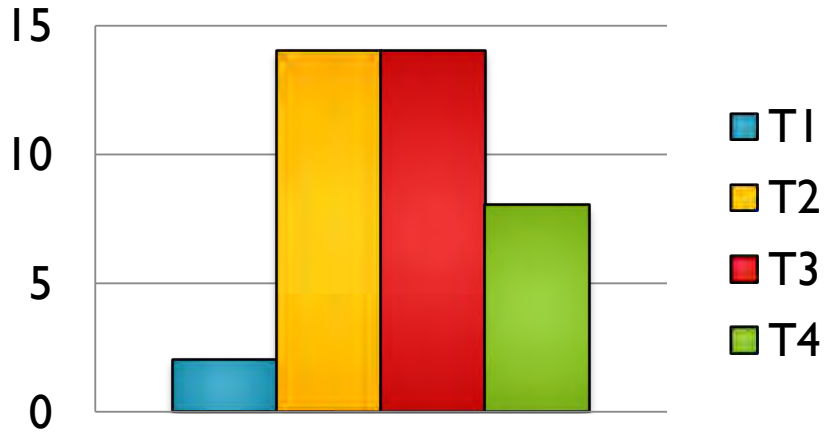
June 24/25th 2016
Novara, Italy

METHODS

From 1995 to 2015: 38 patients were treated with Surgery, EBRT and IORT

Age ranged: 38 to 81 year	**N+: 7 patients**
15 males and 23 females	**Maximal clinical diameter: 6.2cm (median: 2cm)**



Clinical cancer stages:

Hospital General Universitario Gregorio Marañón

Comunidad de Madrid

9th International ISIORT Conference

June 24/25th 2016
Novara, Italy

METHODS

- Surgical procedures were:
  - 25 duodeno-cephalo-pancreatectomy
  - 6 total pancreatectomy.

- EBRT was combined with concomitant chemotherapy in 73,6%
  - Preoperative 55%
  - Median dose 45Gy (range 45 – 50.4Gy)

Hospital General Universitario Gregorio Marañón

SaludMadrid

9th International ISIORT Conference

June 24/25th 2016
Novara, Italy

IOERT characteristics were:

Electron Energies	: 6MeV to 18MeV (8MeV 36.8%)
Applicator diameter used	: 8 cm (42.1%)
Doses range	:10Gy to 17.5Gy (Mean dose:12.5Gy)

Hospital General Universitario Gregorio Marañón

Comunidad de Madrid

9th International ISIORT Conference

June 24/25th 2016
Novara, Italy

RESULTS:

- Postoperative complication rate was 44.7% (17/38).

- With a median follow-up time of 22 months:
  - Loco-regional control (85%)
  - Disease free and overall survival were 36%, 38%, respectively at 3 years.

Hospital General Universitario Gregorio Marañón

SaludMadrid

Comunidad de Madrid

9th International ISIORT Conference

June 24/25th 2016
Novara, Italy

RESULTS:

Long term survivors >4 years were 9 patients (32%) included stages:

- T1 1 patient (11%)
- T2 2 patients (22%)
- T3 4 patients (44%)
- T4 2 patients (22%)

Hospital General Universitario Gregorio Marañón

INTRA-OPERATIVE RADIOTHERAPY (IORT) FOR LOCALLY ADVANCED ESOPHAGEAL CANCER: PRELIMINARY RESULTS IN A SERIES OF 16 PATIENTS.

L. Turri[1], V. Burgio[1], E. Ferrara[1], S. Gentilli[2], C. Bolchini[1], G. Loi[3], M. Krengli[1]

[1] Radiotherapy, [2] Surgery, [3] Medical Physics, University Hospital Maggiore della Carità, Novara

Corresponding author: Prof. M. Krengli, University Hospital Maggiore della Carità, C.so Mazzini 18, 28100 Novara; tel 0321-3733424; fax 0321-3733698; e-mail: krengli@med.unipmn.it

Purpose

To describe our experience in the use of intraoperative radiotherapy (IORT) as a boost after preoperative chemo-radiotherapy in patients with locally advanced esophageal cancer candidates for surgical resection.

Materials and Methods

From 2007 to 2012, sixteen patients (pts), 11 males and 5 females, aged from 49 to 75 years (mean 61.2, median 59.5) with locally advanced esophageal cancer were enrolled in our institutional protocol after multidisciplinary discussion and were candidate to pre-operative chemo-radiation followed by surgery with IORT boost. Locations were: 2 in upper, 8 in middle, and 6 in lower esophageal third. Pathology was squamous cell carcinoma in 14 cases and adenocarcinoma in 2 cases. Clinical TNM stages were as follow: 5 pts T3N0M0, 6 pts T3N1M0, 2 pts T3N0M1, 1 pts T3N2M0, 1 pts T4N0M0 and 1 pts T4N1M0. The two M1 pts had sub-diaphragmatic lymph nodes enlarged at CT-scan and FDG-PET positive. Pre-operative radiotherapy was prescribed with conformal technique using a treatment plan based on PET/CT fused images to a total dose of 44 Gy in 22 fractions (2 Gy/fraction). Chemotherapy was given concomitantly to radiotherapy with cisplatin and 5-fluorouracil for 2 cycles. IORT was delivered after surgical resection to the tumor bed and/or regional lymph nodal areas by a dedicated linear accelerator (Mobetron, Intraop, Sunnyvale, CA) using electron beams of 6, 9 or 12 MeV to a total dose 10-15 Gy.

Results

Two of 16 pts received preoperative RT alone because of severe renal failure. One pts did not received preoperative external beam radiotherapy because of onset of symptomatic mediastinitis requiring upfront surgery. Three pts developed chemo-related hematologic (G4) and one pt renal/hepatic toxicity (G1). Surgery consisted of total esophagectomy with standard mediastinal lymphadenectomy and neck esogastric anastomosis in 14/16 pts; 1/16 pts received sub-total esophagectomy and neck esogastric anastomosis and 1/16 distal esophagectomy with small curvature gastic resection and splenectomy. Pathological stages were as follow: 2 pT1N0M0, 1 pT2N0M0, 2 pT3N0M0, 7 pT3N1M0, 2 pT3N0M1, 1 pT4N3M0. One pt died just after the surgical procedure. 11/15 pts were R0, 2 R1, and 2 R2. Postoperative complications occurred in 7/15 cases and consisted of pulmonary embolism, gastro-tracheal fistula, gastric perforation with mediastinitis, respiratory distress. At median follow up of 23 months (range 1-77), only one of 16 patients is alive without tumor progression. Causes of death were: 10 tumor progression,1 pulmonary embolism, 1 severe pulmonary distress and 1 of cardiac failure. Tumor progression occurred in two cases for both regional and distant relapse and in 8 cases with distant relapse only.

Conclusion

IORT during surgery for esophageal carcinoma seems to be a feasible procedure and can be combined with preoperative chemo-radiotherapy, although toxicity is not negligable. Larger number of patient and longer follow-up are needed to assess long-term outcome including late side effects, local control and relapse-free and overall survival.

Fundación Hospital Provincial Castellón

In vivo dosimetry in IORT treatments

Dr. Juan López Tarjuelo, M.Sc., Ph.D.
Medical Physicist

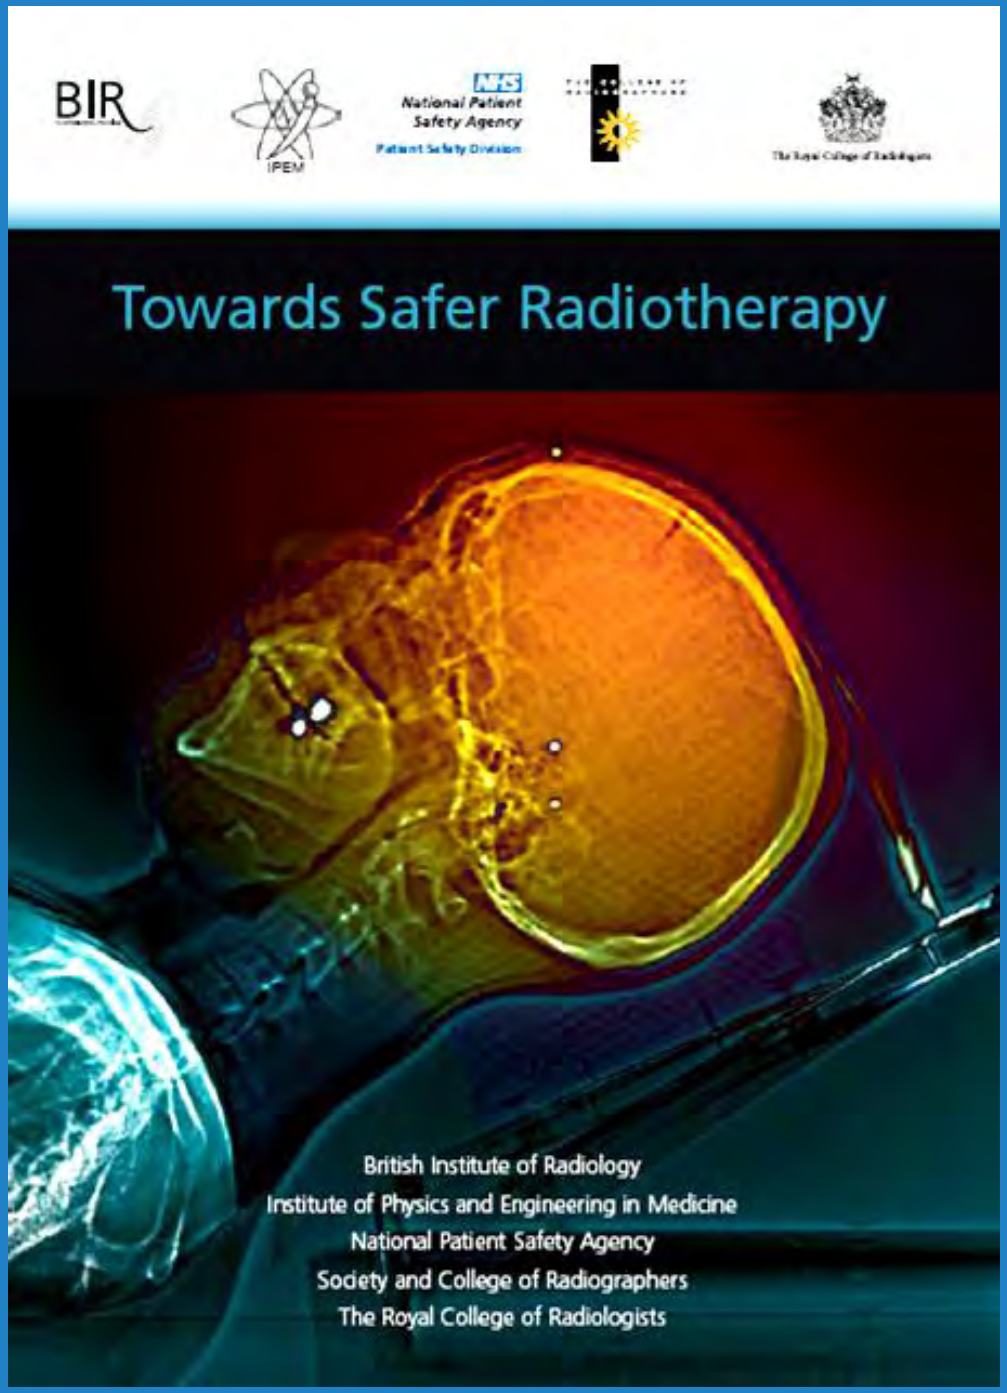
Consorci Hospitalari Provincial de Castelló

DIPUTACIÓ DE CASTELLÓ

GENERALITAT VALENCIANA

In vivo **dosimetry is conceptually easy…**

…but challenging in practice



Recommended by scientific societies

and also regulated

In France

The requirement for in vivo dosimetry (IVD) is one of the French National Cancer Institute (INCa) authorisation criteria for practicing external radiotherapy, an integral part of the system of authorisation for cancer treatment (2007 decree). This requirement was implemented in the framework of the French radiotherapy measures specified in 2007.

Approval criterion no. 15 stipulates: "In vivo dosimetry is to be performed for each technically measurable beam during the first or second irradiation session, as well as at each modification in the treatment". In order to assist radiotherapy centres in observing this requirement as soon as possible and under the best possible conditions, the INCa financed equipment for radiotherapy centres in the private or public sector in the amount of € 3.1M in 2008.

The 2013 French radiotherapy observatory indicates that at the end of December 2012, all the centres that had responded (168/172) were equipped with in vivo dosimetry systems.

68% of the centres use IVD for all their treatments in which beams are technically measurable, with the share of non-technically measurable beams estimated at 21% on average. The most widespread equipment is that of direct readout type, 93% of which uses semiconductor diodes. Most centres have defined an action threshold at 5% discrepancy between the measured dose and the calculated dose.

And in Europe?

A survey was conducted by ASN among 30 European countries (the 27 Member States in June 2013, Norway, Switzerland and Iceland). Twelve countries responded.

IVD is not mandatory for all beams in most European countries (Austria, Finland, Belgium, Germany, Greece, United Kingdom, Estonia, and Lithuania).

IVD has been mandatory in Sweden since 2000, in Denmark since 2001, in Norway since 2004, and is mandatory in the Czech Republic.

In Austria, IVD is mandatory only for total-body irradiation.

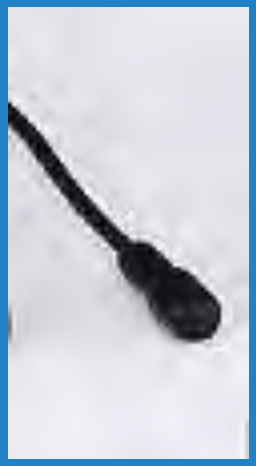
In Finland, quality assurance for treatment planning must include verification of each individual treatment plan using a procedure optimally independent of the treatment planning system. In addition, every total-body irradiation must include an in vivo dose measurement. Use of in vivo dosimetry is also recommended for other types of radiotherapy.

IVD is considered good practice:

- in Belgium: the National Institute for Health and Disability Insurance (INAMI) reimburses four IVD sessions per patient;

- in the United Kingdom: in 2007, the Chief Medical Officer[1] of England wrote in his report that IVD should be progressively introduced.

Specific recommendations for IORT



Detectors – Essential requirements

- Small-sized detectors, handy
- Readout independent of temperature, absorbed dose rate, and beam energy
- Ease of use – Multidisciplinary handling

TECHNICAL PAPER

Thermoluminescence dosimetry for skin dose assessment during intraoperative radiotherapy for early breast cancer

P. Fogg · K. R. Das · T. Kron · C. Fox · B. Chua · J. Hagekyriakou

Received: 7 April 2008 / Accepted: 17 January 2010 / Published online: 9 July 2010

Abstract Dosimetry for intraoperative radiotherapy (IORT) after wide local excision for breast cancer using a 50 kV X-ray needle (Intrabeam) was performed in vivo using thermoluminescence dosimetry. Eight LiF:Mg,Ti chips were placed on the skin around the incision site after wide local excision while the tumour bed was irradiated to

of spherical applicators used in the delivery of IORT targeted at the tumour bed after wide local excision in women with early breast cancer.

The device as described in the literature [1, 2], produces a near isotropic beam at the probe tip of energies 30, 40 and 50 kVp. Treatment applicator sphere sizes range from 1.5

Summary

In vivo dosimetry using thermoluminescent dosimeters may be used to estimate skin doses during single-fraction intraoperative radiotherapy of the breast using

Purpose: *In vivo* dosimetry provides an independent check of delivered dose and gives confidence in the introduction or consistency of radiotherapy techniques. Single-fraction intraoperative radiotherapy of the breast can be performed with the Intrabeam compact, mobile 50 kV x-ray source (Carl Zeiss Surgical, Oberkochen, Germany). Thermoluminescent dosimeters (TLDs) can be used to estimate skin doses during these treatments.

Methods and Materials: Measurements of skin doses were taken using TLDs for 72 patients over 3 years of clinical treatments. Phantom studies were also undertaken to assess the uncertainties resulting from changes in beam quality and backscatter conditions *in vivo*.

Intraoperative electron radiation therapy (IOERT) cannot usually benefit, as conventional external radiotherapy, from software systems of treatment planning based on computed tomography and from common dose verify procedures. For this reason, *in vivo* film dosimetry (IVFD) proves to be an effective methodology to evaluate the actual radiation dose delivered to the target. A practical method for IVFD during breast IOERT was carried out to improve information on the dose actually delivered to the tumor target and on the alignment of the shielding disk with respect to the electron beam. Two EBT3 GAFCHROMIC films have been positioned on the two sides of the shielding disk in order to obtain the dose maps at the target and beyond the disk. Moreover the postprocessing analysis of the dose distribution measured on the films provides a quantitative estimate of the misalignment between the

Received 4 December 2002; received in revised form 19 August 2003; accepted 12 September 2003

Abstract

Background and purpose: To check the dose delivered to patients during intraoperative electron beam radiation therapy (IOERT) for early breast cancer and also to define appropriate action levels.

Patients and methods: Between December 2000 and June 2001, 54 patients affected by early-stage breast cancer underwent exclusive IOERT to the tumour bed using a Novac7 mobile linac, after quadrantectomy. Electron beams (5, 7, 9 MeV) at high dose per pulse values (0.02–0.09 Gy/pulse) were used. The prescribed single dose was 21 Gy at the depth of 90% isodose (14–22 mm). In 35 cases, in vivo dosimetry was performed. The entrance dose was derived from the surface dose measured with thin and calibrated MD-55-2 radiochromic films, wrapped in sterile envelopes. Films were analysed 24–72 h after the irradiation using a charge-coupled-device imaging system. Field

Purpose: To investigate the use of metal oxide silicon field effect transistors (MOSFETs) as *in vivo* dosimetry detectors during electron beams at high dose-per-pulse intraoperative radiotherapy.
Methods and Materials: The MOSFET system response in terms of reproducibility, energy, dose rate and temperature dependence, dose-linearity from 1 to 25 Gy, angular response, and dose perturbation was analyzed in the 6–9-MeV electron beam energy range produced by an intraoperative radiotherapy-dedicated mobile accelerator. We compared these with the 6- and 9-MeV electron beams produced by a conventional accelerator.

Abstract

Purpose: In a previous paper we reported the results of off-line in vivo measurements using radiochromic films in IOERT. In the present study, a further step was made, aiming at the improvement of the effectiveness of in vivo dosimetry, based on a real-time check of the dose.

Materials and methods: Entrance dose was determined using micro-MOSFET detectors placed inside a thin, sterile, transparent catheter. The epoxy side of the detector was faced towards the beam to minimize the anisotropy. Each detector was plugged into a bias supply (standard sensitivity) and calibrated at 5 Gy using 6 MeV electrons produced by a conventional linac. Detectors were characterized in terms of linearity, precision and dose per pulse dependence. No

ABSTRACT

Purpose: To optimize the dose delivery to the breast lumpectomy target treated with intraoperative electron beam radiotherapy (IOERT).

Materials and methods: Two tools have been developed in our MU calculation software NEMO X to improve the dose homogeneity and the in-vivo dosimetry effectiveness for IOERT treatments. Given the target (tumor bed) thickness measured by the surgeon, NEMO X can provide auto dose normalization to cover 95% of the target volume with 95% of the prescription dose (PD) and a "best guess" of the expected dosimeter dose (EDD) for a deep seated in-vivo dosimeter. The tools have been validated with

MOSFET detectors

Clinical implementation of MOSFET detectors for dosimetry in electron beams

Esther J. Bloemen-van Gurp*, Andre W.H. Minken, Ben J. Mijnheer, Cary J.G. Dehing-Oberye, Philippe Lambin

Department of Radiation Oncology (MAASTRO), University Hospital Maastricht, Maastricht, The Netherlands

Abstract

Background and purpose: To determine the factors converting the reading of a MOSFET detector placed on the patient's skin without additional build-up to the dose at the depth of dose maximum (D_{max}) and investigate their feasibility for in vivo dose measurements in electron beams.

Materials and methods: Factors were determined to relate the reading of a MOSFET detector to D_{max} for 4–15 MeV electron beams in reference conditions. The influence of variation in field size, SSD, angle and field shape on the MOSFET reading, obtained without additional build-up, was evaluated using 4, 8 and 15 MeV beams and compared to ionisation chamber data at the depth of dose maximum (z_{max}). Patient entrance in vivo measurements included 40 patients, mostly

Total		42	9	51
Fisher's exact test		*p*		0.501

NO association

Conclusions

In vivo **dosimetry is basically successful, even with the studied factors**

Detector choice should depend on user factors (budget, training, reporting needs, etc.) and not on detector factors

Concerned and committed surgeons are crucial to succeed

In vivo dosimetry in intraoperative electron radiotherapy

microMOSFETs, radiochromic films and a general-purpose linac

Intraoperative electron radiotherapy (IOERT) is a highly selective radiotherapy technique aimed at restricted anatomic volumes during surgical oncology treatment. It consists of single-fraction irradiation with a high delivered absorbed dose after direct visual examination of the tumor bed by means of an electron beam [1]. Currently, it is being revisited and reported on intensively [2–4].

creas. The differences between intended and measured absorbed doses ranged from −6.9 to 11.6%.

Ciocca et al. [7] performed entrance absorbed dose measurements on 45 breast cancer patients irradiated with NOVAC7 and LIAC mobile linacs. The differences between intended and measured absorbed doses ranged from −7.6 to 10%.

Soriani et al. [8] also used a NOVAC7

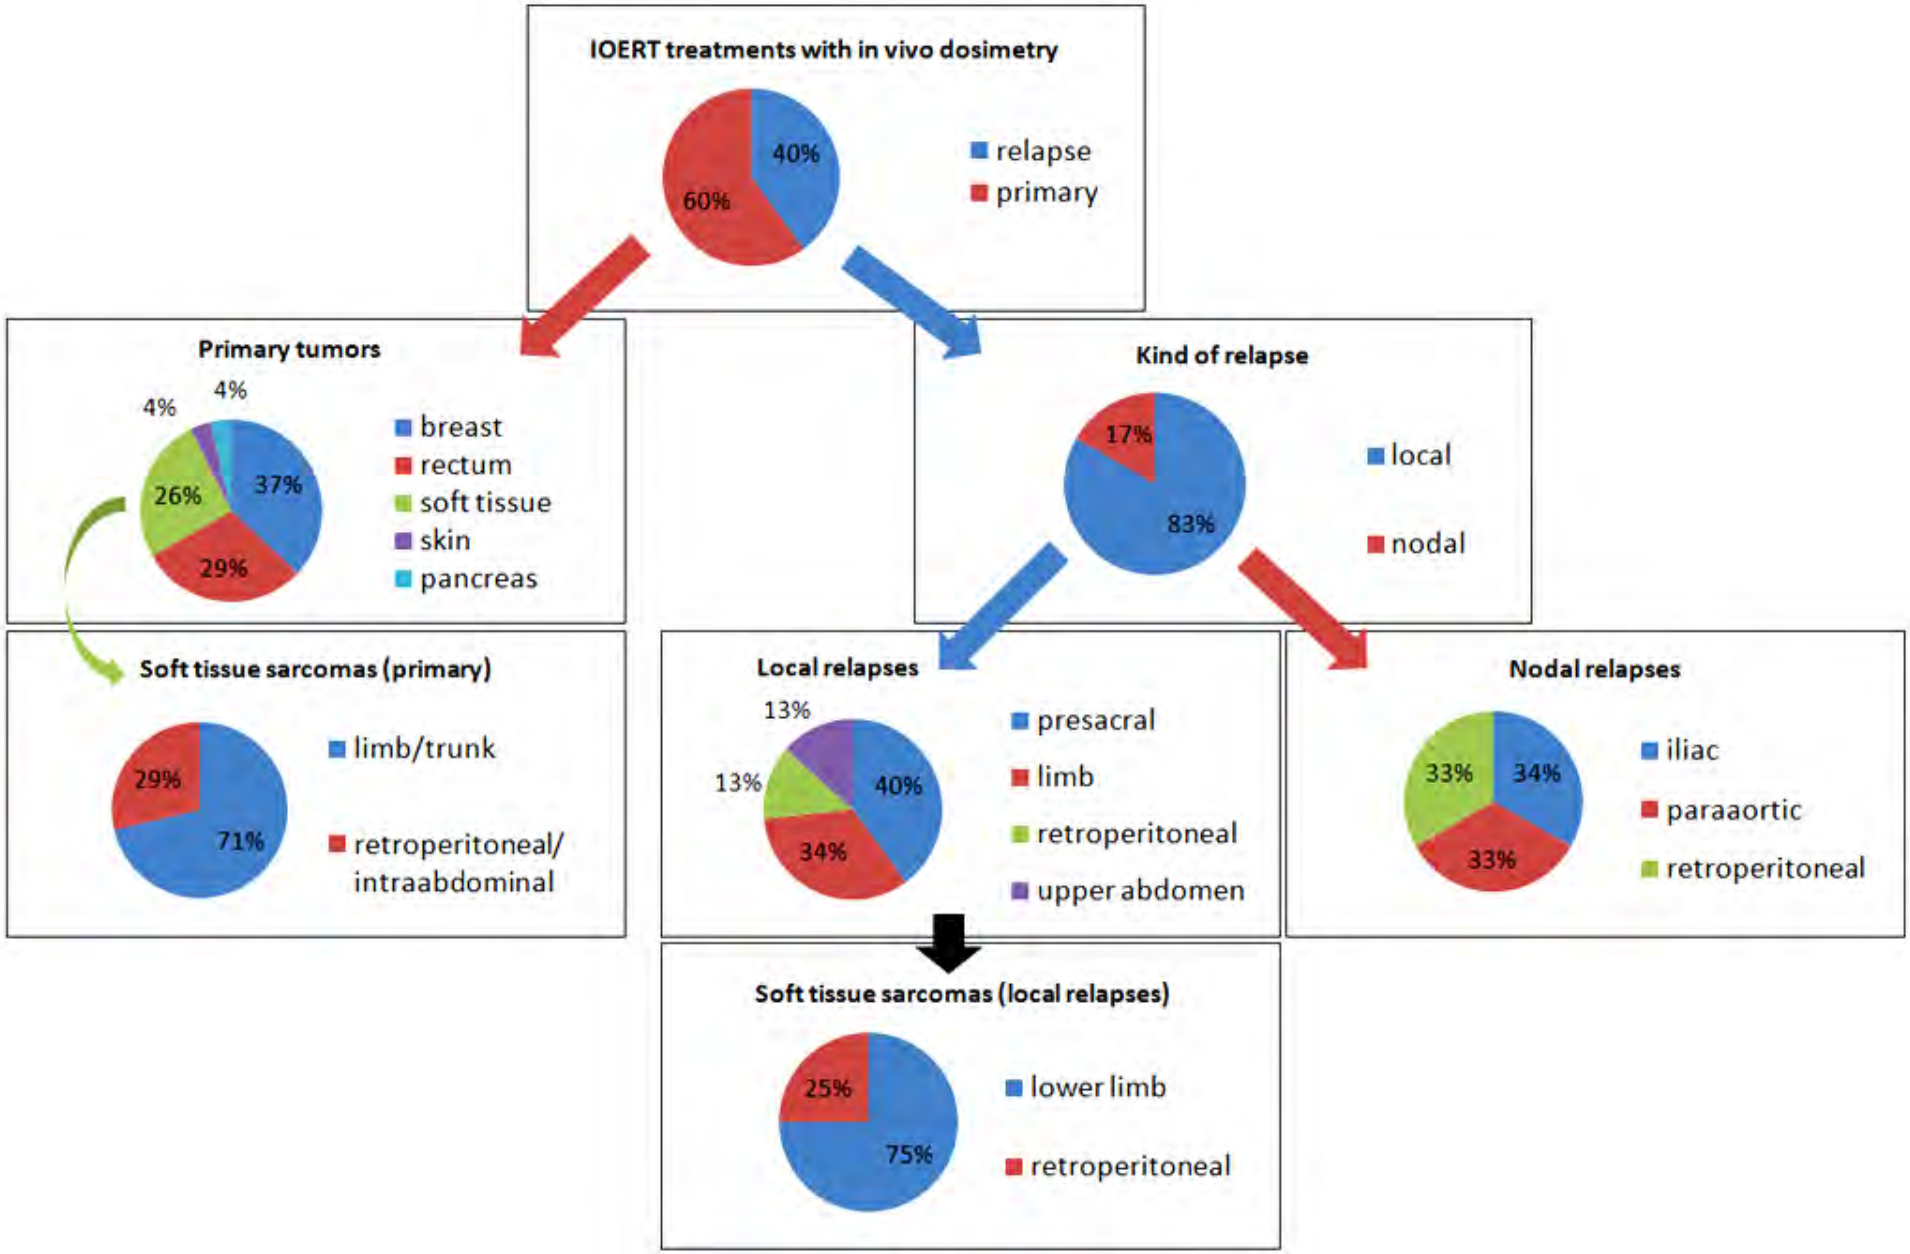
Krengli et al. [11] presented a study of 38 patients with locally advanced prostate cancer irradiated with a Mobetron mobile linac. Film dosimetry focused on measuring absorbed dose to the rectum.

Here, our aim was to share our experience in in vivo dosimetry with both MOSFETs and radiochromic films with patients undergoing IOERT using a general-purpose linac. We report the intrin-

Second question

In vivo dosimetry as a feasible program?

45 patients, 27 primary tumors, 18 relapses



Dosimetric parameters

Implementation of an intraoperative electron radiotherapy in vivo dosimetry program

Juan López-Tarjuelo[1*], Virginia Morillo-Macías[2,3], Ana Bouché-Babiloni[2], Enrique Boldó-Roda[4], Rafael Lozoya-Albacar[4] and Carlos Ferrer-Albiach[2,5]

Abstract

Background: Intraoperative electron radiotherapy (IOERT) is a highly selective radiotherapy technique which aims to treat restricted anatomic volumes during oncological surgery and is now the subject of intense re-evaluation. In vivo dosimetry has been recommended for IOERT and has been identified as a risk-reduction intervention in the context of an IOERT risk analysis. Despite reports of fruitful experiences, information about in vivo dosimetry in intraoperative radiotherapy is somewhat scarce. Therefore, the aim of this paper is to report our experience in developing a program of in vivo dosimetry for IOERT, from both multidisciplinary and practical approaches, in a consistent patient series. We also report several current weaknesses.

Methods: Reinforced TN-502RDM-H mobile metal oxide semiconductor field effect transistors (MOSFETs) and Gafchromic MD-55-2 films were used as a redundant in vivo treatment verification system with an Elekta Precise fixed linear accelerator for calibrations and treatments. In vivo dosimetry was performed in 45 patients in cases involving primary tumors or relapses. The most frequent primary tumors were breast (37 %) and colorectal (29 %), and local recurrences among relapses was 83 %. We made 50 attempts to measure with

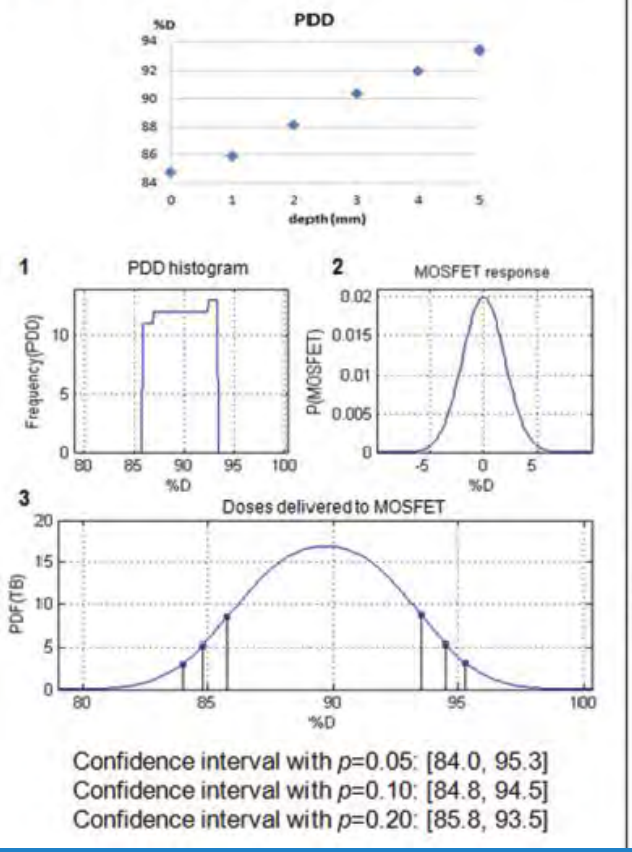
Third question

How to derive predictive action levels?

Physical model with 30 MOSFET measurements

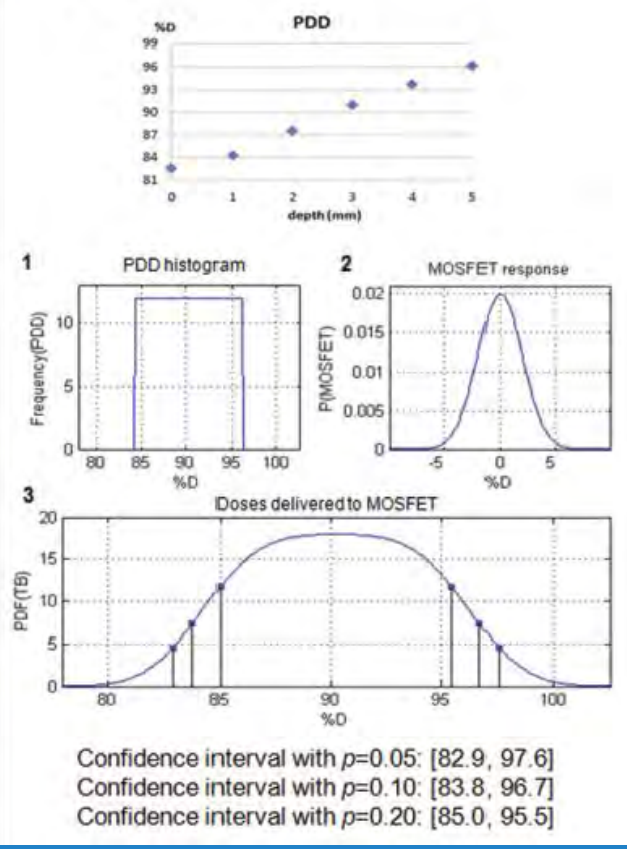
Convolution of the involved 5 mm of PDD with detector response (2%)

a) 5 cm, 9 MeV, 30°



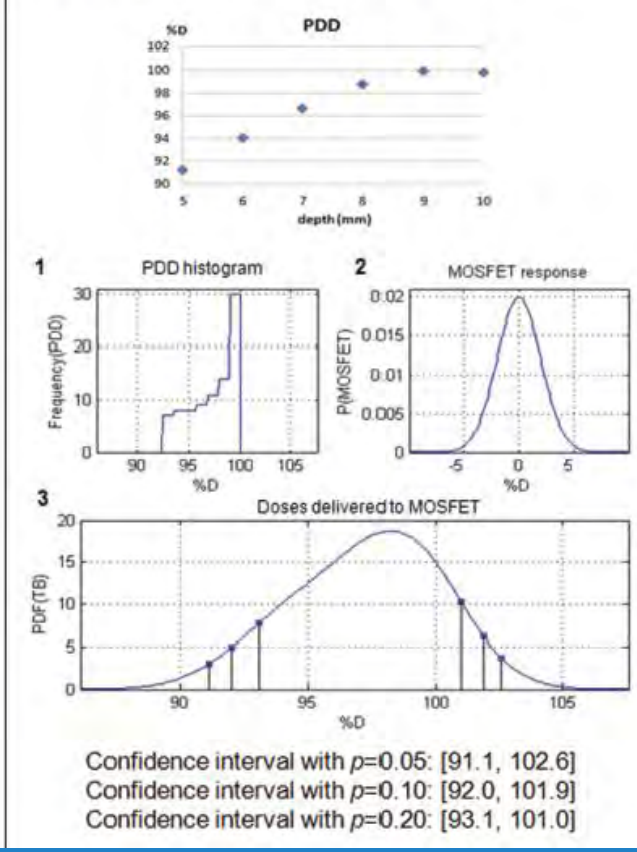
Confidence interval with p=0.05: [84.0, 95.3]
Confidence interval with p=0.10: [84.8, 94.5]
Confidence interval with p=0.20: [85.8, 93.5]

b) 6 cm, 9 MeV, 45°



Confidence interval with p=0.05: [82.9, 97.6]
Confidence interval with p=0.10: [83.8, 96.7]
Confidence interval with p=0.20: [85.0, 95.5]

c) 7 cm, 4 MeV, 0°, 5 mm bolus



Confidence interval with p=0.05: [91.1, 102.6]
Confidence interval with p=0.10: [92.0, 101.9]
Confidence interval with p=0.20: [93.1, 101.0]

We also made comparisons with the mean of the PDD portion considered

For example, if $u_c(y)$ is dominated by a component of uncertainty evaluated from a rectangular distribution whose bounds are assumed to be exactly known, it is possible [if $t_p(\nu_{\text{eff}}) > \sqrt{3}$] that $y + U_p$ and $y - U_p$, the upper and lower limits of the interval defined by U_p, could lie outside the bounds of the probability distribution of the output quantity Y. Such cases must be dealt with on an individual basis but are often amenable to an approximate analytic treatment (involving, for example, the convolution of a normal distribution with a rectangular distribution [10]).

Applicator diameter, (cm)	Energy, (MeV)	Bevel angle, (°)	5-mm Bolus Present	Mean PDD, %	Lower AL, %, $P = .05$	Upper AL, %, $P = .05$	Confidence Interval Width, %	D_{MOSFET}, %	Result of Comparison

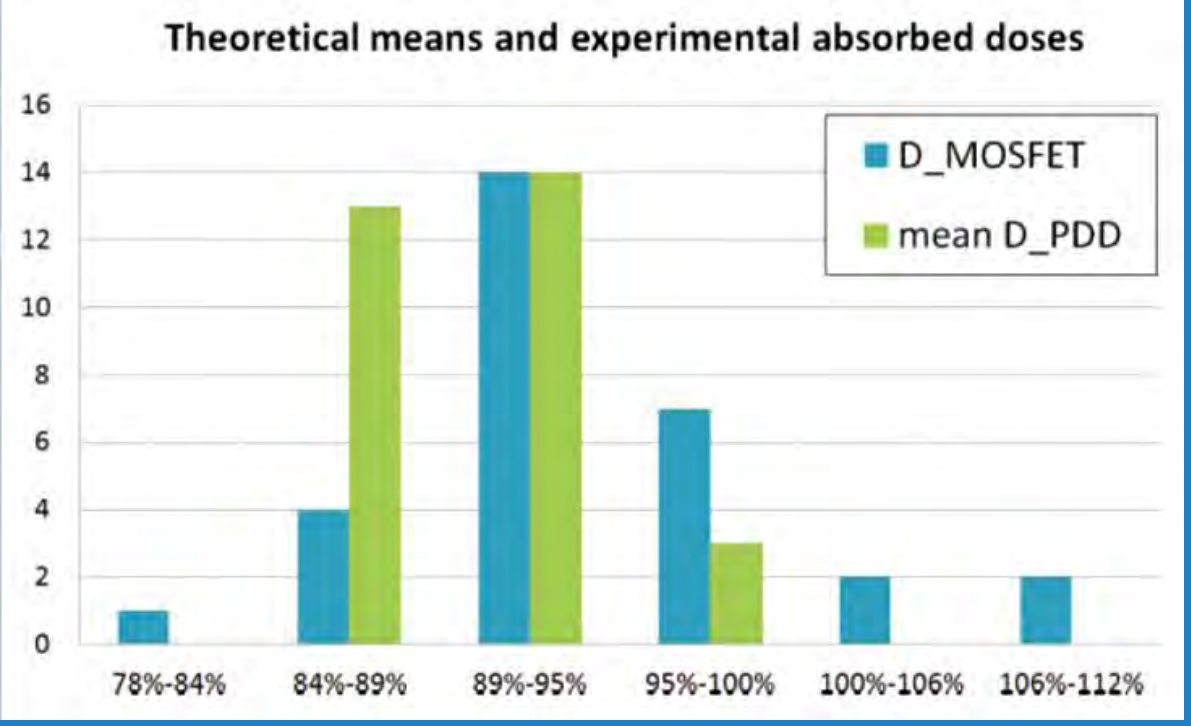
10	12	0	Yes	93.8	89.7	98.3	8.6	97.7	Inside
12	4	0	Yes	96.7	91.0	102.5	11.5	87.0	Lower
12	6	0	Yes	93.8	88.8	99.4	10.6	95.8	Inside



Procedure theoretical mean: 90.3%

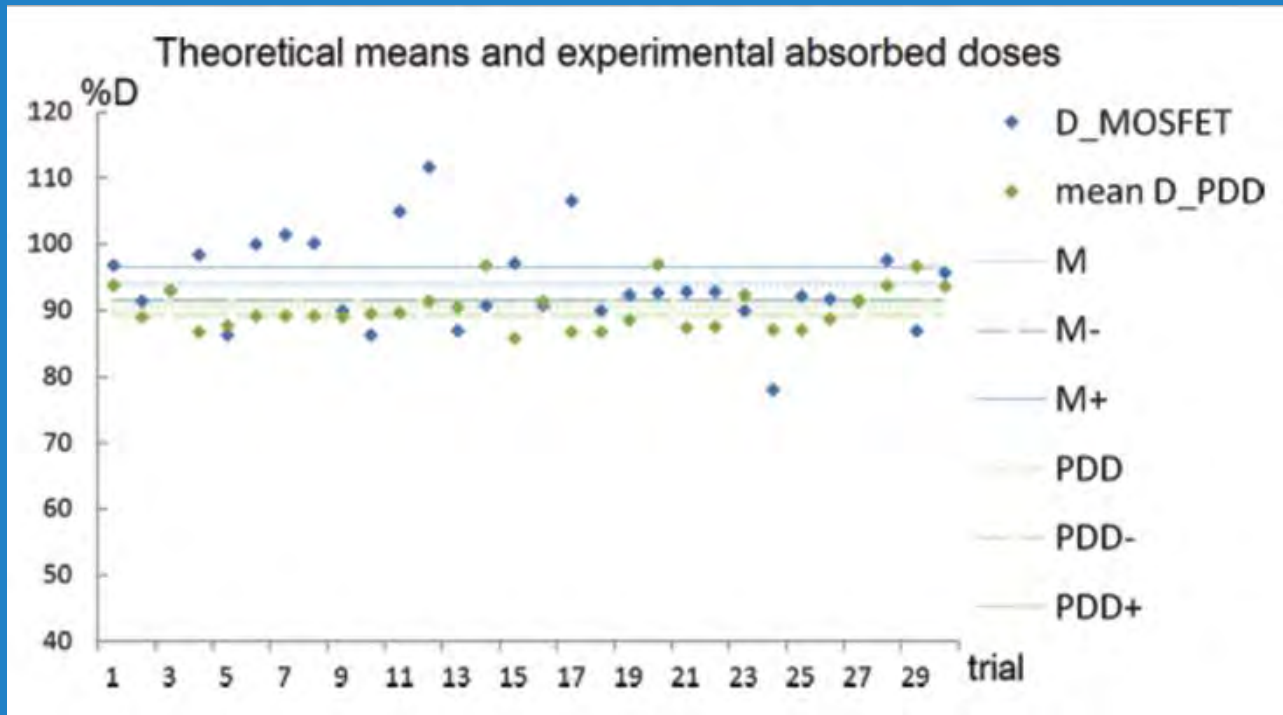
***In vivo* data mean: 93.9%**

Significantly shifted (p=0.023)

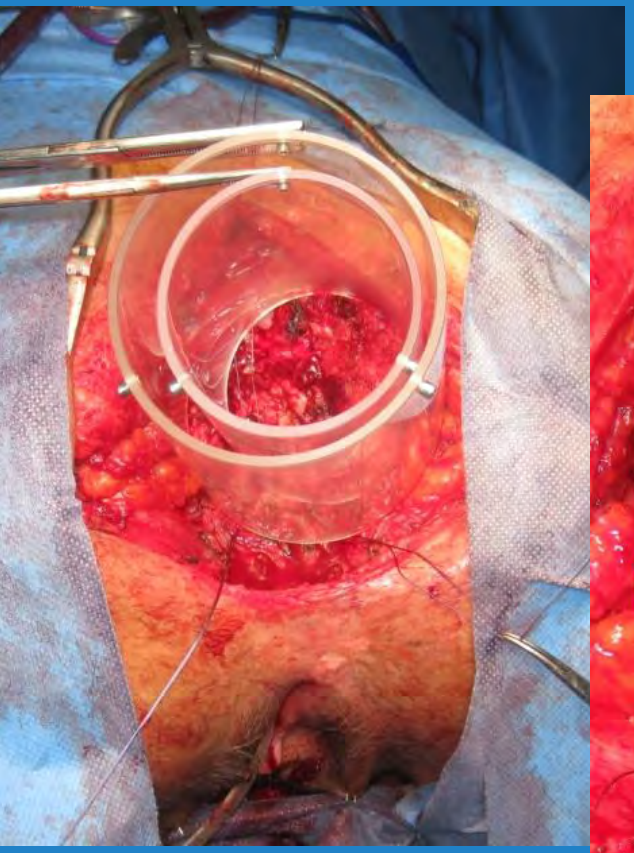
95% confidence intervals

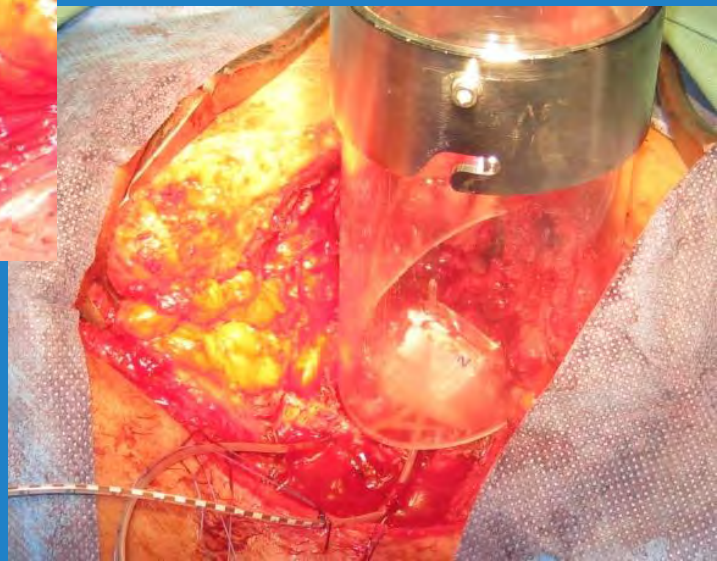
89.2% and 91.4%;

and 91.6% and 96.4%.

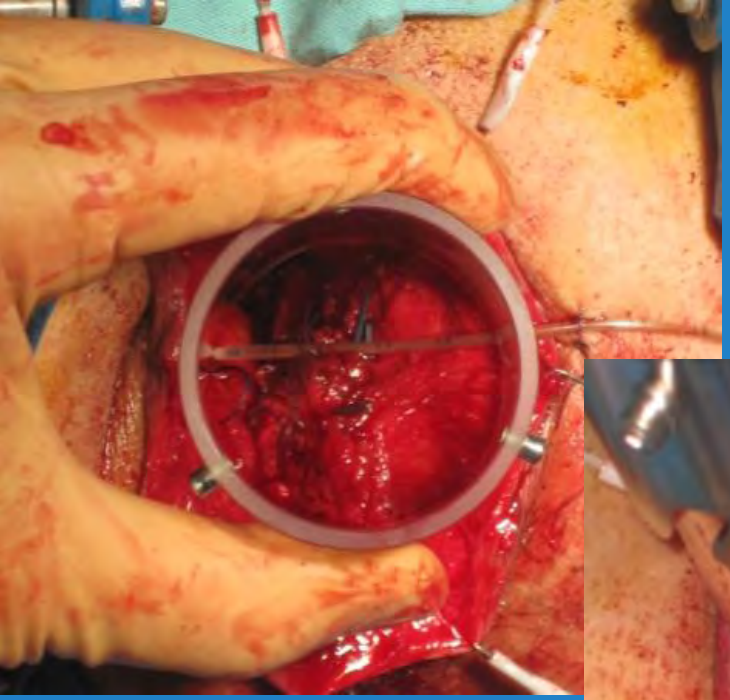


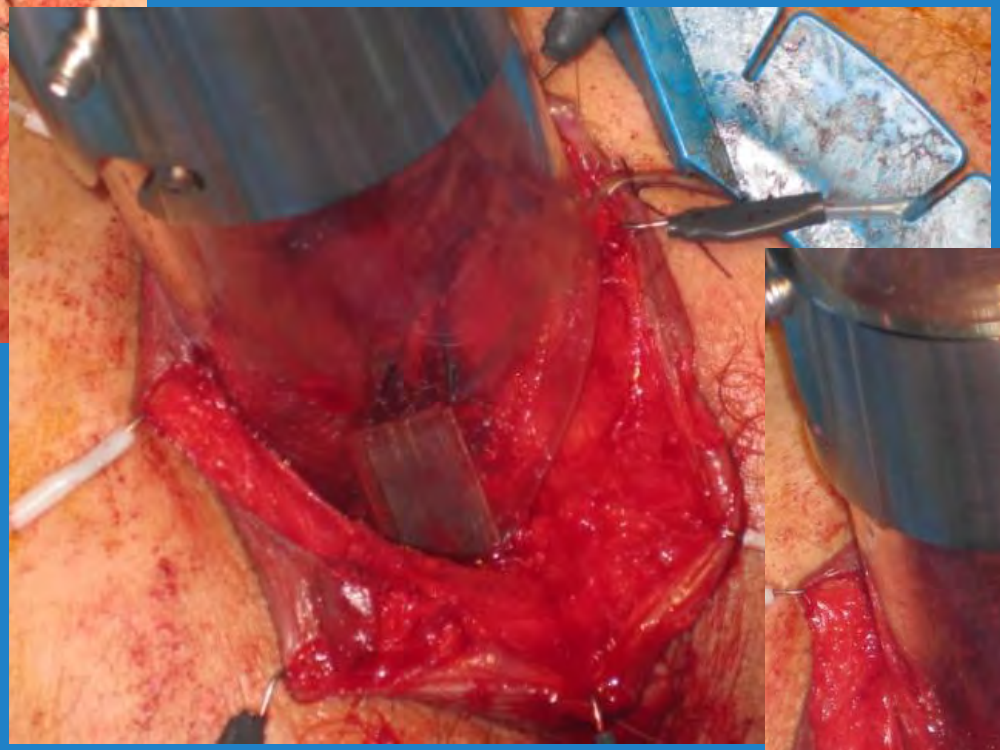
Bed relief can be very pronounced





and detector placement, tricky





Conclusions

It is difficult to obtain very precise measurements

Wide set of localizations. Good global results, central values inside the treatment band (93%-94%).

Range of deviations higher than in studies on a unique localization

Films as a redundant system, compatible with MOSFETs (97.9% ± 3.6%, p=0.112)

Difference with respect the model (+3.6%). 27% of data above the upper limit → blood? obliquity? → we would need a detector localization system and more precise dosimeters

Abstract

In vivo dosimetry is recommended in intraoperative electron radiotherapy (IOERT). To perform real-time treatment monitoring, action levels (ALs) have to be calculated. Empirical approaches based on observation of samples have been reported previously, however, our aim is to present a predictive model for calculating ALs and to verify their validity with our experimental data. We considered the range of absorbed doses delivered to our detector by means of the percentage depth dose for the electron beams used. Then, we calculated the absorbed dose histograms and convoluted them with detector responses to obtain probability density functions in order to find ALs as certain probability levels. Our in vivo dosimeters were reinforced TN-502RDM-H mobile

Guidelines for quality assurance in intra-operative radiation therapy

English version

Edited by Antonella Rosi and Vincenza Viti

Laboratorio di Fisica

ISSN 1123-3117

Rapporti ISTISAN 03/1 EN

“Mission”

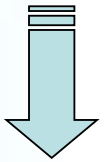
- Updating the current ISS guidelines
- define a shared procedure for the IORT method.
- Write a new AIFM report of integration of ISS guidelines

Summary

- Reference dosimetry
- Relative dosimetry
- In vivo dosimetry
- MC calculation
- Special cases

Dosimetry in reference conditions

For dedicated accelerators, characterised by a high dose/pulse, **it is impossible** to follow all the recommendations of the protocols (IAEA, AAPM)



Ionization chambers cannot be employed and no published dosimetry protocol can be used."

IAEA TRS-398

$D_{w,Q} = k_{t,p} * k_{pol} * k_s * M_Q * N_{D,w,Q0} * K_{Q,Q0}$

Conventional Dose-per-pulse:
the TVA method

$$k_s = a_o + a_1\left(\frac{M_1}{M_2}\right) + a_2\left(\frac{M_1}{M_2}\right)^2$$

BUT

This works for only 0.1-0.6 cGy/pulse

"In these guidelines (AAPM TG 72, ISS),

for the mesurement of the absorbed dose to water in reference conditions the use of the absolute dosimetric system of **Fricke** *is recommended. "*

A good solution is represented also by **Alanine dosimetry"**

Physicists like ionization chambers!

Fricke: chemical dosimeter based on a solution of iron sulphate

New methods for k_{sat} evaluation

"**Di Martino**" Method

"Ion recombiantion correction for very high dose-per-pulse high-energy electron Beams";

Med. Phys. 32 (7), 2204-2210 (2005)

"**Guerra**" Method

"Charge collection efficiency in ionization chambers exposed to electron beams with high dose per pulse";

Phys. Med. Biol. 51 (24), 6419-6436 (2006)

During these years several Italian centers have tested these methods, by comparing ionometric results with Fricke or Alanine.

They have shown to work well.

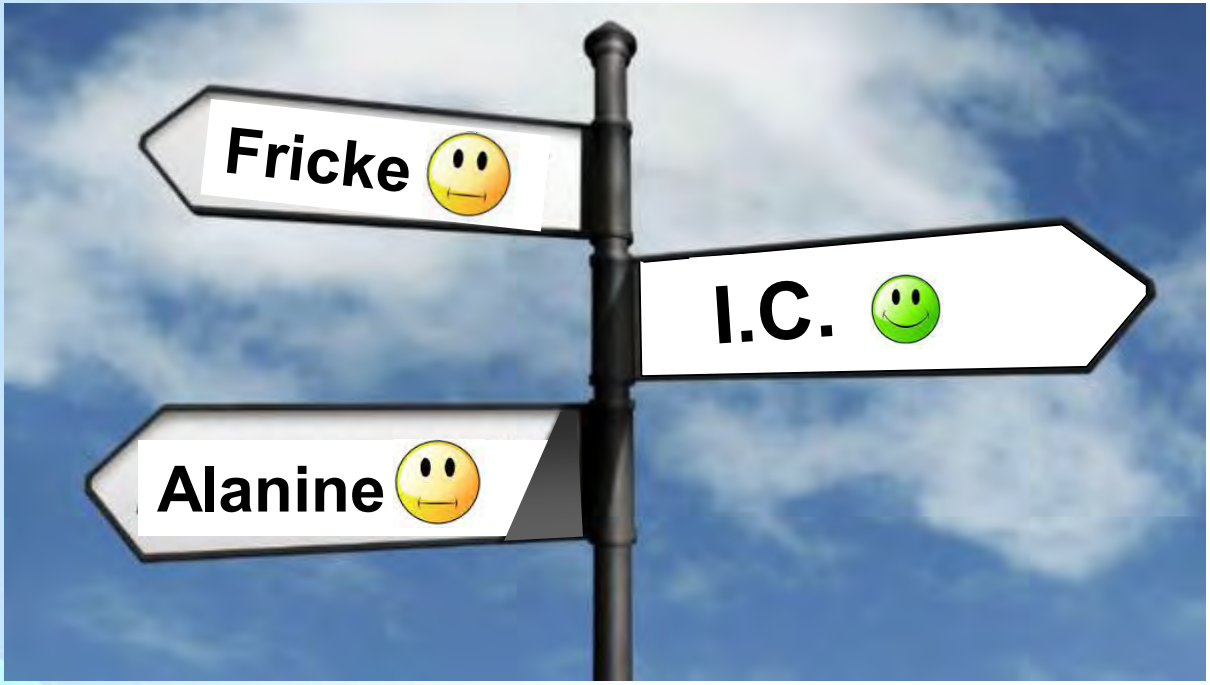
a paper was submitted for publication at "Medical Physics" : "Use of parallel-plate ionization chambers in reference dosimetry of NOVAC and LIAC mobile electron linear accelerators for intraoperative radiotherapy: a multi-center survey. " P. Scalchi et al.

→ 64 energies were checked

The main information in this paper is the potential to use the ionization chamber instead of the chemical dosimetry to calibrate the LINAC

It is under evaluation awaiting publication……..

So Today…



We'd like to suggest to the ISS (and we hope also to IAEA) the new guidelines,

in which these ionometric methods are accepted as new standards.

State of the art

23 centers (1 center uses conventional Linac)

- In vivo dosimetry is perfomed in 16 centers
  → of this: 14 centers it is a routine practice (about 70%)

- MOSFET or Gafchromic™

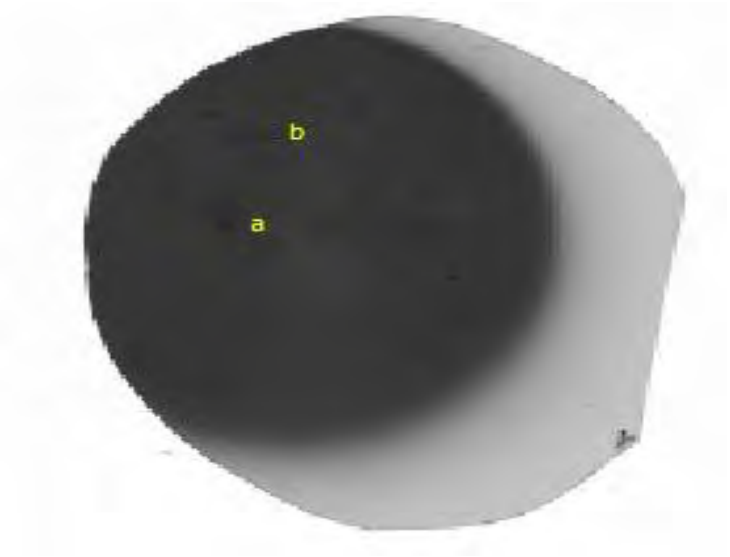
What to check?

- **Beam output** using a dosimeter arranged on the target surface: 5 centers
- **Target dose delivered** with the dosimeter in the deeper part, embedded together with the shield (for breast treat.): 7 centers
- **Double checks** (input and output dose to the target) in 4 centers

Recommended:

Setup checks using GAFchromic above the shielding disc

- **Essential:** at the beginning with all the surgeons
- **Recommended:** always



Work in progress

1. Pregnant women

2. Cardiac implantable electronic devices carriers

A chapter about it will be insert in the AIFM report

Pregnant women

Is electron beam intraoperative radiotherapy safe in pregnant women with early breast cancer?

In vivo dosimetry to assess fetal dose

A couple of TLDs were positioned on **non** pregnant patients skin in 4 different positions and in uterus

Prescribed dose	Right ovary	Left ovary	Suprapubic	Sub-diaphragmatic	Uterus
Gy	mGy	mGy	mGy	mGy	mGy
21	0.925	1.001	0.776		0.57
21	0.453	0.443	0.384	1.639	0.3
12	0.677	0.557	0.435	2.902	0.366
21	0.881	0.814	0.682	1.98	0.485
12	0.314	0.293	0.576	7.758	0.261

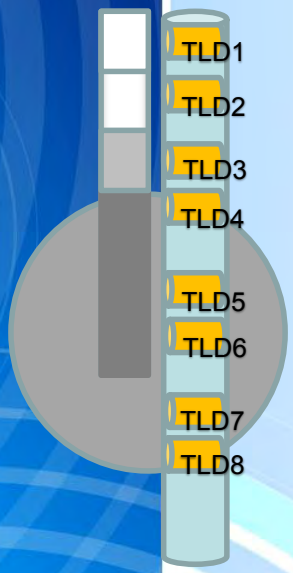
In December 2011 a pregnant woman, affected by early stage breast cancer, underwent conservative surgery and ELIOT full dose (21 Gy at 90% isodose) during the 15th gestation week

Comparing the data on the skin between non pregnant women and the pregnant one, we evaluated that the expected dose to the foetus should have been 0.84 mGy

ELIOT offers the pregnant woman the choice of receiving breast-conserving surgery, without exposing her baby to a significant radiation risk, and preserves her breast

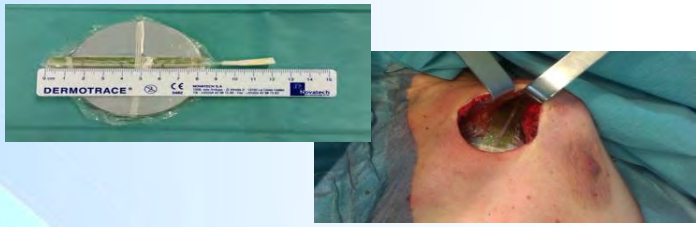
Cardiac implantable electronic devices carriers

Two catheters with 8 TLDs



The first catheter was attached to the thoracic shielding

The catheter tip was positioned in the subclavicular region, where a cardiac device would be placed



The second catheter was placed on the patient skin, parallel to the first one, next to the applicator

ELIOT seems to be safe for patients using cardiac devices as long as the minimum distance of 2.5 cm is kept between the cardiac device edge and the applicator wall

IORT anti-tumoral activity in Breast Cancer includes the molecular alteration of the post-surgical microenvironment

9TH INTERNATIONAL ISIORT CONFERENCE

NOVARA 24/25TH JUNE 2016

Gustavo Baldassarre, MD
Molecular Oncology Unit
CRO-National Cancer Institute
Aviano - Italy

Question

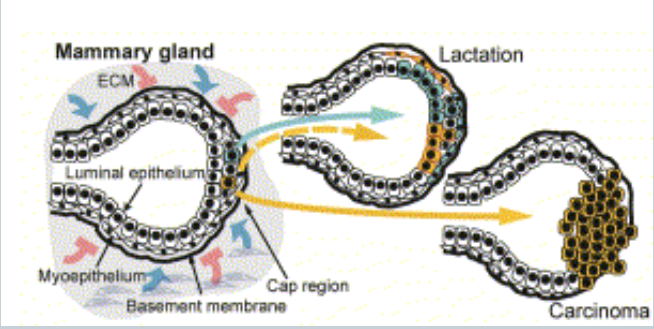
If 60% of primary breast tumors are multifocal as evidenced by RNM studies

why

approximately 90% of the recurrences occurs at the site of wound?

Background

- Since more than 30 years now it has been hypothesized that tumors act as wounds that do not heal (Dvorak NEJM, 1986)
- We have then learned that tumor development and progression is the result of a complex interaction between cancer cells and local microenvironment
- A normal microenvironment can preserve the tissue architecture even in the presence of predisposed cells thereby preventing tumor progression
- Vice versa an aberrant microenvironment can promote the mutated cells to form tumors



WF & Serum Collection

- The day prior to surgery the patient receive a blood drawing;

Drawing of Pre-surgery Serum

- **At the end of the surgery (with or without IORT) drainage fluid from breast surgical wound (WF) is collected for 24 hours;**

Drainage of Post-surgery Serum (**WF**)

- Both the Pre-surgery serum and the WF are promptly sent to the Experimental Oncology Lab where they are processed, aliquoted and stored at -80° C until needed.

Exp.Onc. Lab

Stimulation of residual Cancer cells proliferation

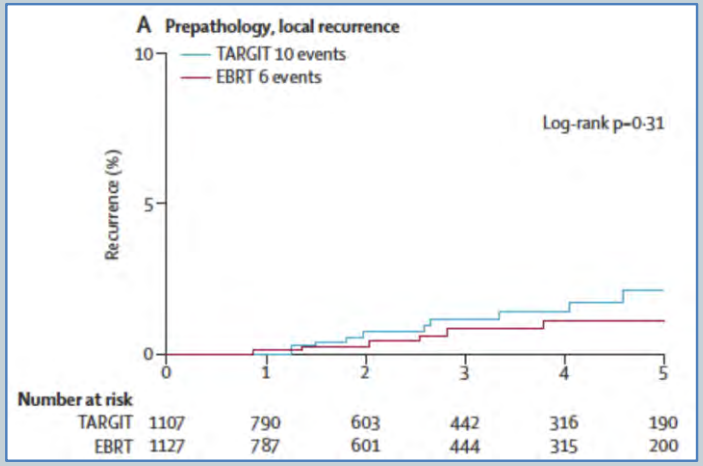
Recurrence

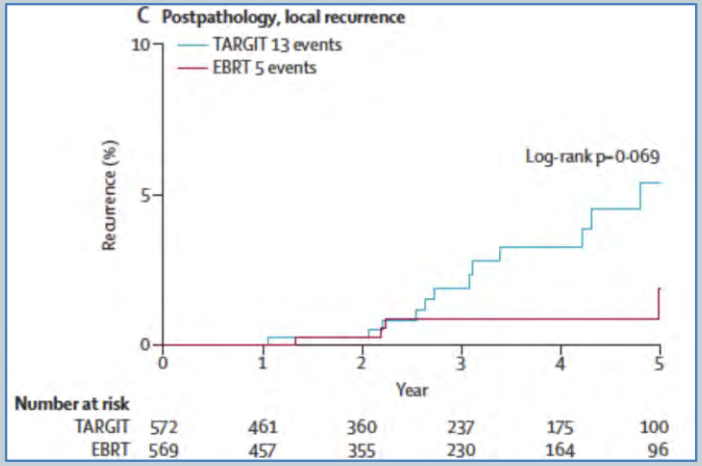
Background

- In this context clinical and experimental evidences collected in breast cancer suggest that **surgery** itself, **by activating the wound healing response**, may provide residual **cancer cells** of the growth factors necessary to **re-grow locally** and/or at distant sites

- Accordingly, after breast conserving surgery, External Beam Radiotherapy reduces by 1/3 the risk of loco-regional recurrences

- Recent evidences suggest that **IORT with Intrabeam** is **not inferior** to EBRT in controlling recurrences formation **when timely applied**.





IORT alters the ability of breast-derived WF to stimulate p70S6K and STAT3 activation

Clinical implications

- ✓ Surgery and the consequent inflammatory response caused by wounding represent factors favoring the BC proliferation and may attract "residual" BC cells to the site of surgery;
- ✓ Our data may explain the high rate of recurrences observed at the site of surgical wound;
- ✓ We also proved that Radiotherapy prevents wound induced cancer cell growth likely through the regulation of miR-233/EGF expression
- ✓ The fact that miR-223 impairs EGF/EGFR signaling opens the way to the design of new peri-operative treatments based on the use of clinically available EGFR inhibitors, to restrain loco-regional and distant recurrences;
- ✓ Altogether, our data also suggest that for anticancer therapies to be really effective it will be necessary not only to find the **right treatment** for the **right patient** (carrying the most relevant target) but also to choose the **right timing** of administration.

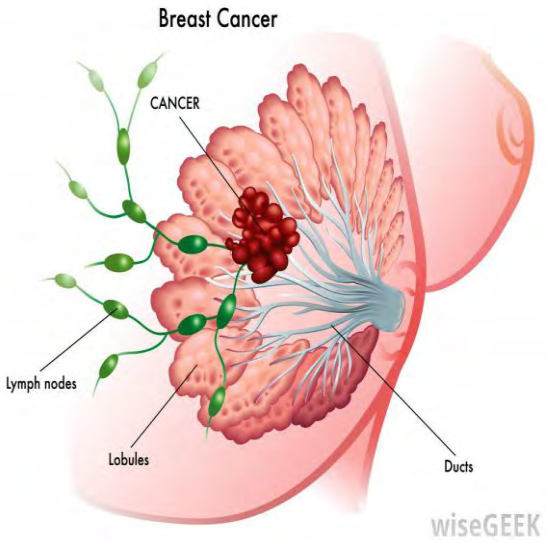
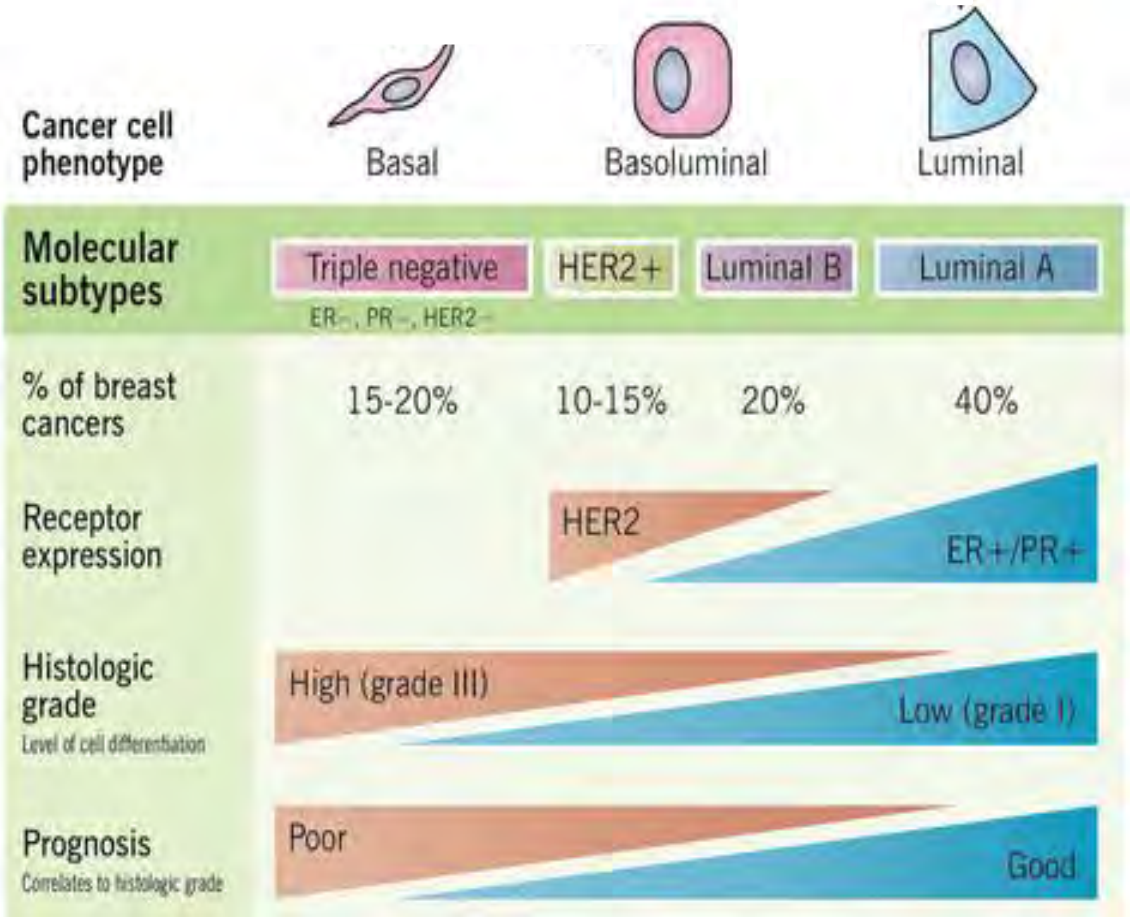
Greater Poland Cancer Centre, Poznań, Poland

wielkopolskie centrum onkologii

Breast cancer biology and treatment



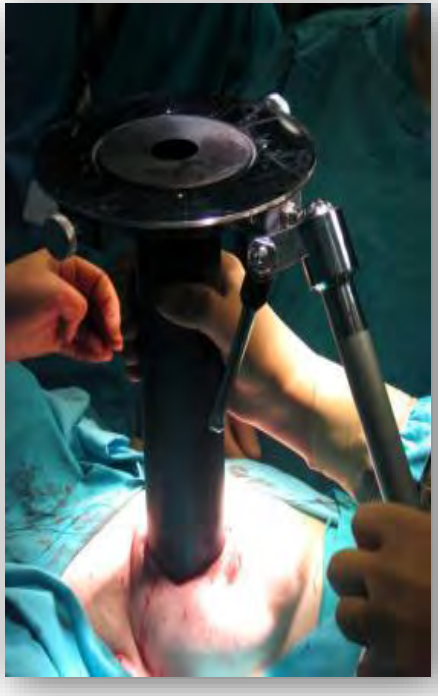


Treatment:

- whole breast irradiation
- chemotherapy
- hormone therapy

Tumor recurrence after conservative treatment -

- 80-90% of tumor recurrence after surgery occur in the same quadrant as the primary cancer
- 90% of cancer cells are located in 4 cm around tumor
- **Tumor bed requires higher radiation dose than whole body radiotherapy (BOOST)**



Mobetron IntraOPMedical Inc.
(Santa Clara, USA)

IORT

Resection of the early breast tumor (up to 30 mm) is followed by BOOST radiation of 10 Gy per tumor bed and surrounding tissues.

What are the advantages of intraoperative RT?

- Saving the surrounding tissue by a gradual decrease in radiation dose and moving away the healthy tissue (skin)
- A more balanced distribution of the dose
- Extremely precise irradiation of the target area - particularly important in the era of oncoplastic surgery
- The surgeon and radiation oncologist precisely identify the volume of tissue which must be irradiated after the act of tumor removal

Wound fluids promotes tumor metastasis

Tumor dormancy and surgery-driven interruption of dormancy in breast cancer: learning from failures.

Demicheli R[1], Retsky MW, Hrushesky WJ, Baum M.

⊕ Author information

Abstract

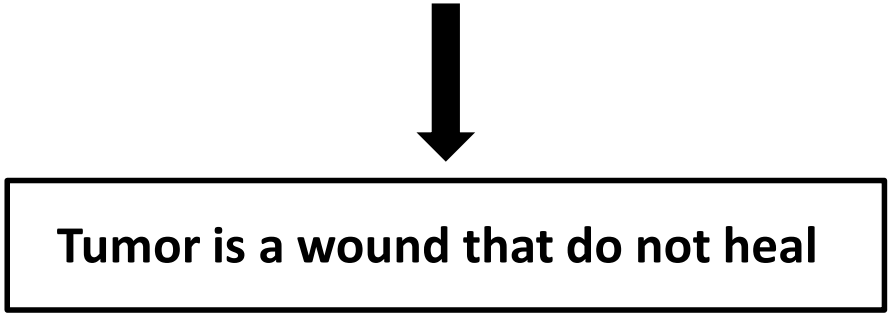
Primary tumor removal, usually considered intrinsically beneficial, can perturb metastatic homeostasis, and for some patients results in the acceleration of metastatic cancer. The continuous-growth model is required to yield to an interrupted-growth model, the implications of which are episodes of tumor dormancy. This Review analyzes the recent evolution of two paradigms related to the development of breast cancer metastases. The evolution of the paradigms described herein is supported by a growing body of findings from experimental models, and is required to explain breast cancer recurrence dynamics for patients undergoing surgery with or without adjuvant chemotherapy.

Published data suggest that the wound healing process after surgery alters the area surrounding the original tumor and the modified microenvironment is more favorable for the tumor recurrence, probably due to stimulatory effects of post-surgical fluids.

Wound fluids promotes tumor metastasis

Wound healing and cancer progression have striking similarities including:

- inflammation
- angiogenesis
- rearrangement of the molecular matrix around the cells



Activation of the „wound response signature" is highly prognostic of poor survival in BC patients which strongly suggests the potential relevance of the wound response induced by surgery.

Wound fluids promotes tumor metastasis

- Apart the mere dose augmentation effect and the high topographic precision in delivery, it was hypothesized that immediate irradiation during surgery has implications on the tumor microenvironment abrogating the proliferative cascade induced by surgical wound healing (Demicheli R Br J Cancer 2001, Tsuchida Y. Surgery. 2003).

- The published data suggest that the wound healing process after surgery alters the area surrounding the original tumor also around the scar, and the modified microenvironment is more favourable for the tumor to recur. Local recurrence after surgery is particularly common in tumors characterized by HER2 overexpression (Menard S, Clin Canc Res. 2002).

- It was shown that wound fluids contain growth factors inducing proliferation of HER2-positive breast cancers (Tagliabue E Lancet. 2003).

Wound fluids promotes tumor-initiating features of breast cancer cells

Not only radiotherapy affects cell survival; also surgery has an impact on tumor microenvironment. Belletti et al. demonstrated the stimulatory effect of post-surgical drainage fluids harvested from a group of patients after IORT treatment and patients after breast conserving surgery on breast cancer cells. It was shown that wound fluids from conservative surgery (without IORT) can stimulate proliferation, migration and invasion of breast cancer cell lines while fluids collected after IORT demonstrated different properties (Belletti B, Clin Cancer Res. 2008).

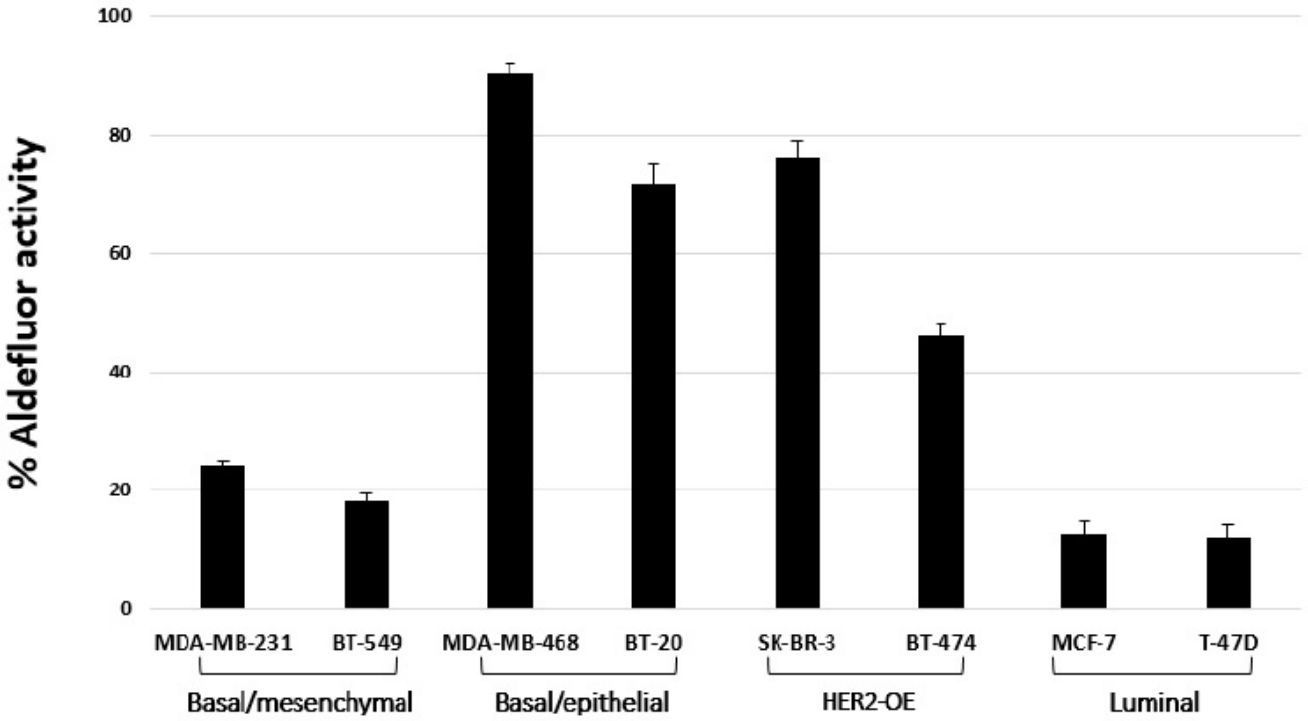
ANALYSIS:

- FACS – **CD44+/CD24-** phenotype
- **RT-qPCR** cancer stem cells phenotype

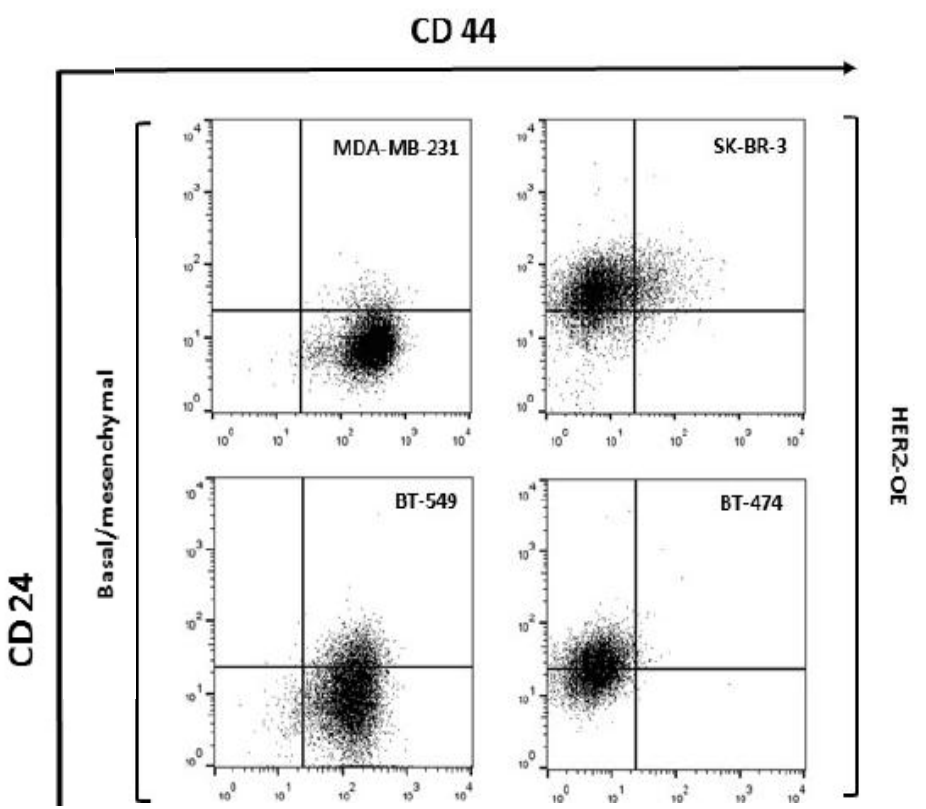
Phenotypic characterisation of a panel of a breast cancer cell lines – CD44/CD24 stem cell like phenotype

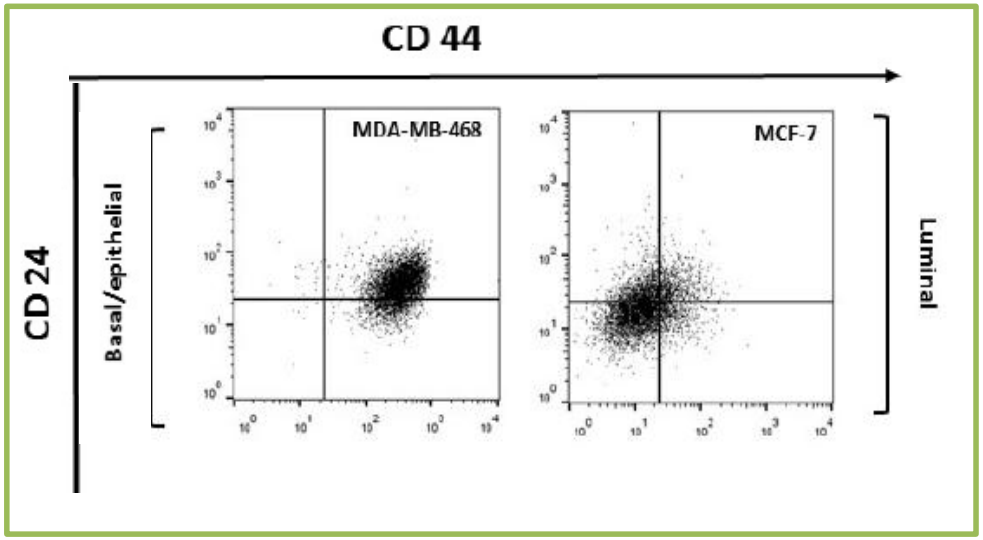


The ALDH 1 positive subpopulation varied between human breast cancer cell lines according to distinct molecular subtypes. Basal/epithelial and HER2 overexpressing protein cell lines represent strong activity of ALDH1. Plotted is the mean of two independent experiments.

Zaleska, Murawa 2016

Phenotypic characterisation of a panel of a breast cancer cell lines – CD44/CD24 stem cell like phenotype





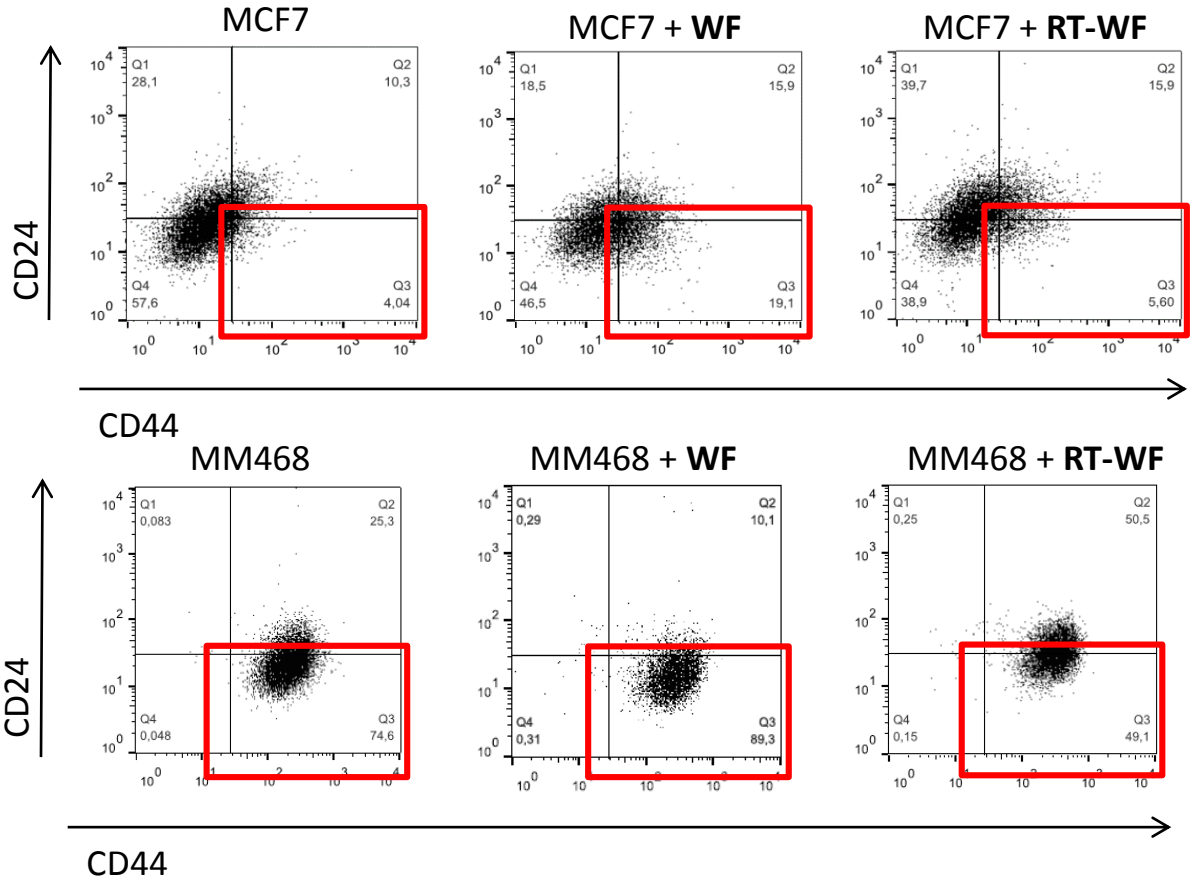
$CD44^{+}/CD24^{low}$

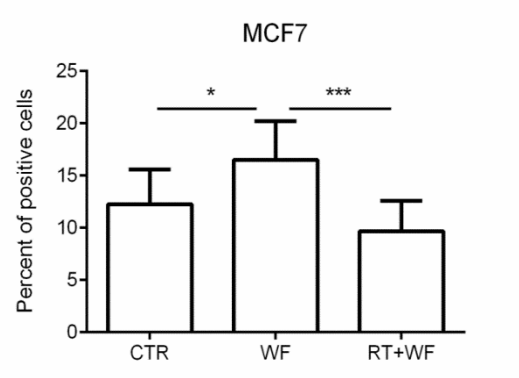
cancer stem cell phenotype

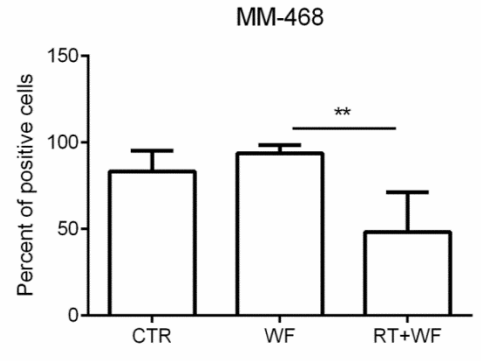
Subpopulations of $CD44^{+}/CD24^{-/low}$ positive cells in human breast cancer cell lines according to distinct molecular subtypes. Basal-like cell lines are mainly constituted by cells with high level of CD44 and low CD24 populations. Plotted is the mean of three independent experiments.

Zaleska, Murawa 2016

IORT treatment impairs the ability of WF to induce cancer-stem cells phenotype in the luminal and basal subtype of breast cancer cells



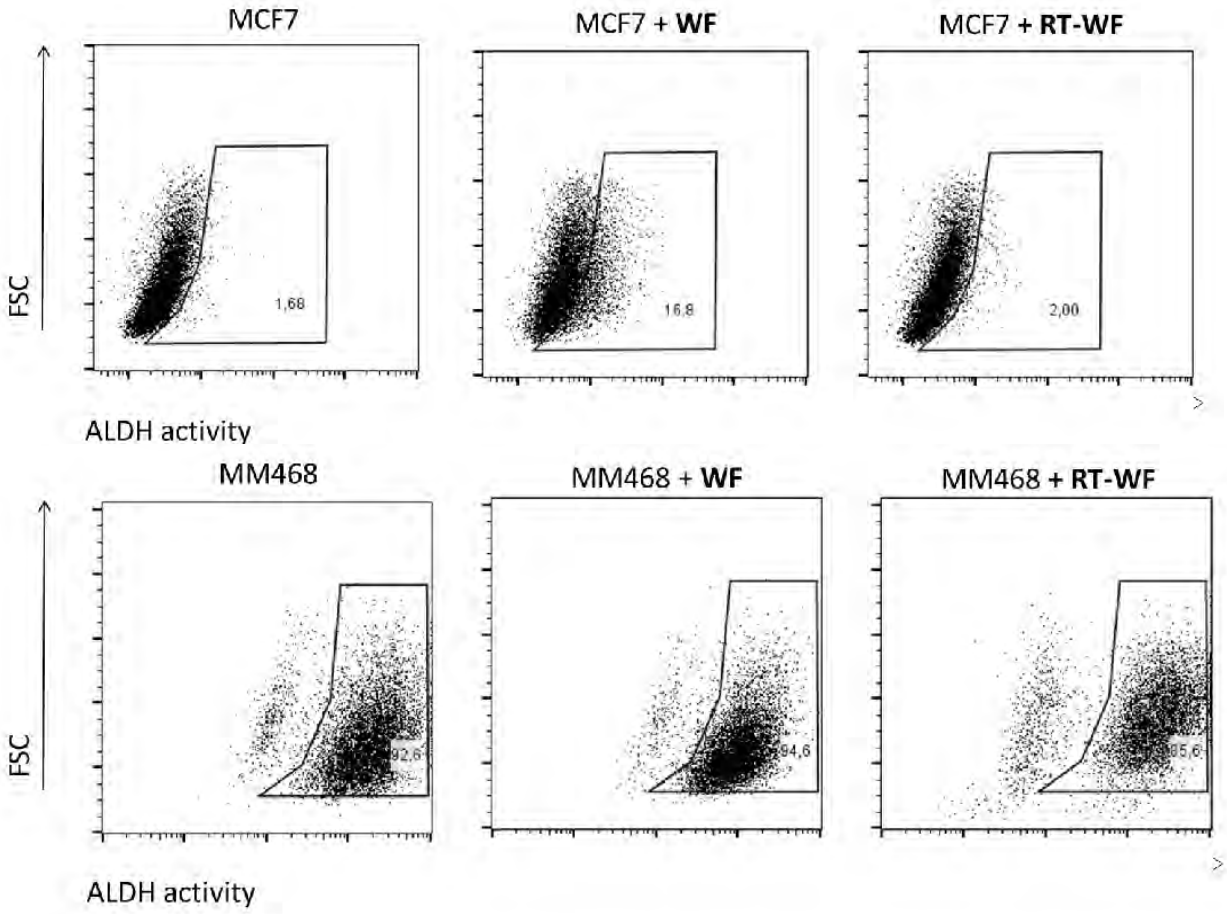


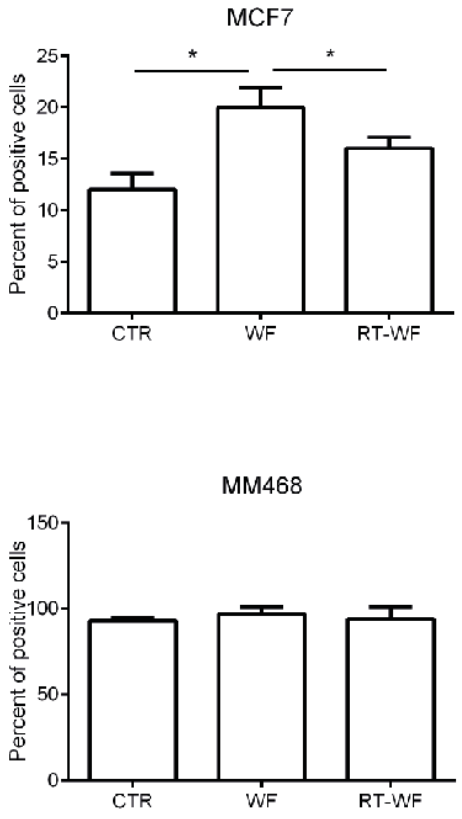


The luminal MCF-7 cell line was mainly constituted by CD24 positive cell, nevertheles a small population of $CD44^{+}/CD24^{-/low}$ decresed significantly due to incubation with RT-WF. Triple negative cell line (MM468) demonstrated stimulating effect of WF and inhibiting of RT-WF compared to control group.

Zaleska, Murawa 2016

Surgical wound fluids affect the aldehyde dehydrogenase activity



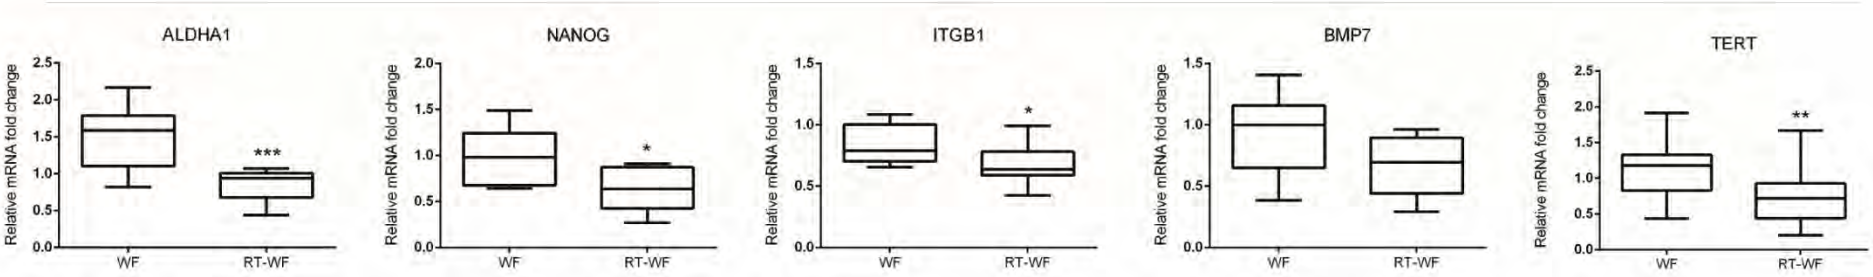


Surgical fluids both from conservative surgery and the IORT procedure induced ALDH activity compared to control group. In luminal MCF7 cell line, surgical wound fluids collected from patients who underwent surgery alone demonstrated stronger stimulating effect compared to the group with the IORT procedure. Triple negative MM-468 cell line did not demonstrate almost any difference in ALDH1 activity between the control group and the treated cells.

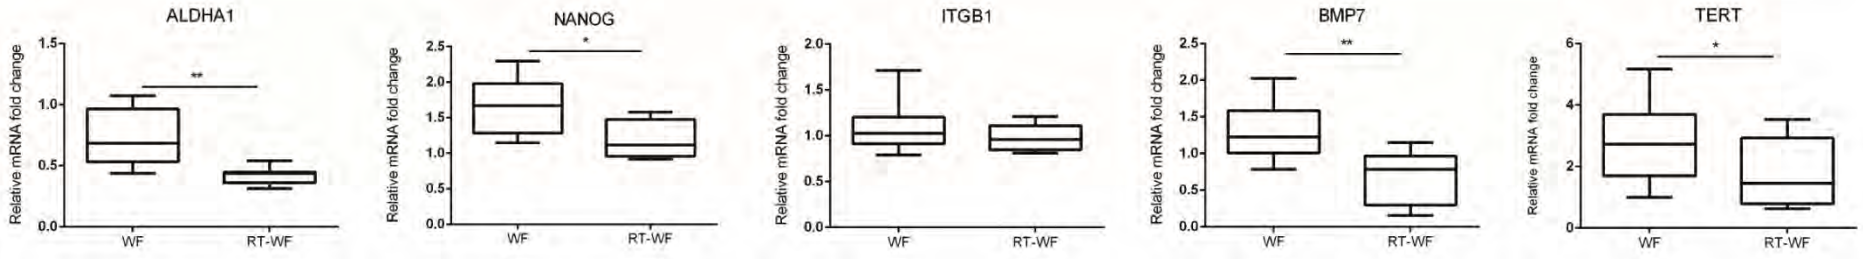
Zaleska, Murawa 2016

IORT treatment affects pluripotency and stemness profile in a luminal and basal subtype of breast cancer cells

Luminal MCF7 cell line



Basal MM-468 cell line

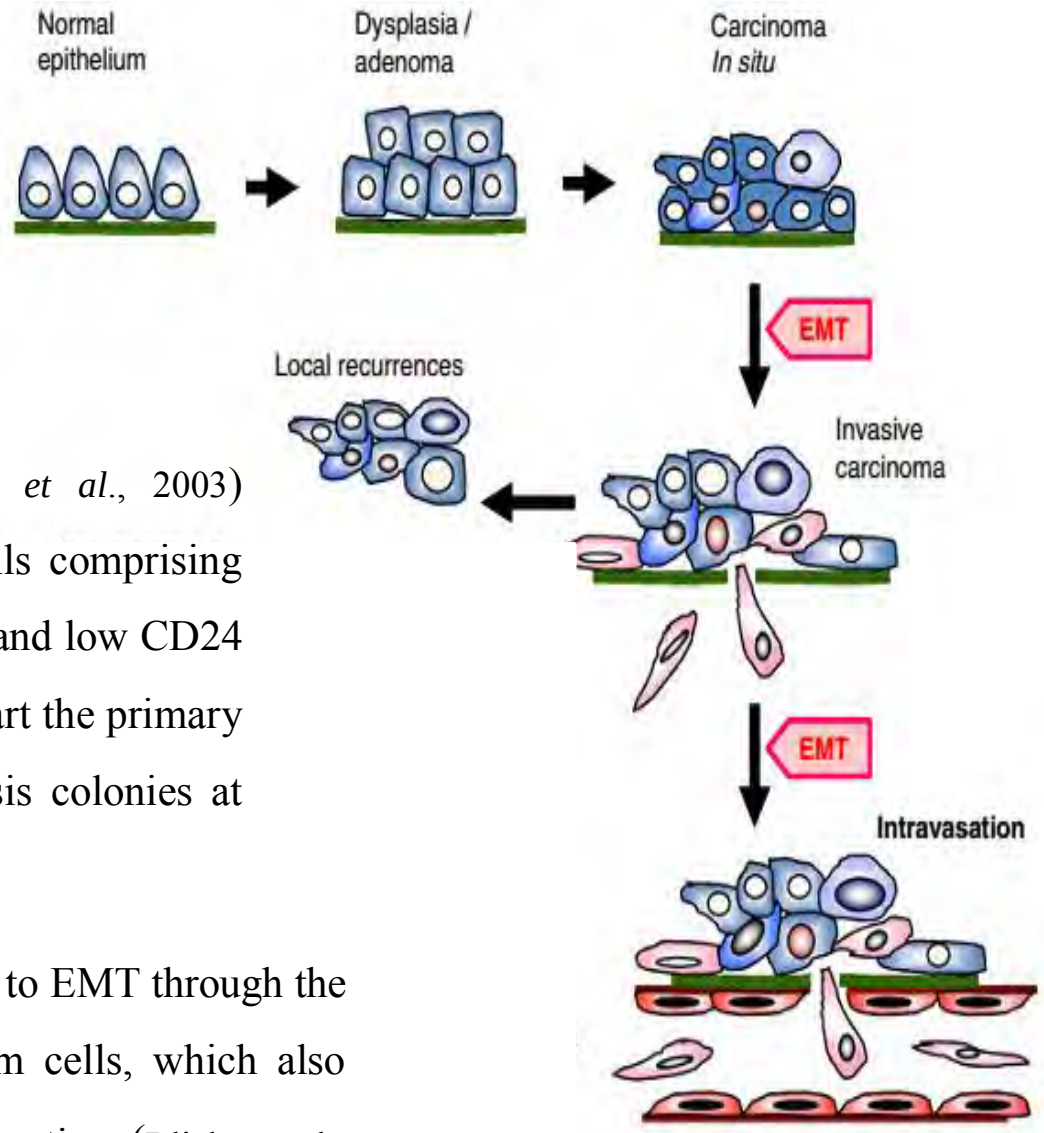


The expression of all analysed markers respresenting stemness profile of luminal and basal subtype of breast cancer cells was significantly increased in group of wound fluids from conservative surgery. IORT treatment decresed those markers in both analysed cell lines.

Kulcenty, Suchorska, Murawa

Tumor progression via epithelial to mesenchymal transition

Epithelial to mesenchymal transition (EMT) process, first described in embryonic development, is one of the main mechanism involved in breast cancer metastasis.



The paradigm of early metastasis (Al-Hajj *et al.*, 2003) suggests that a fraction of primary tumor cells comprising stem cell-like characteristics with high CD44 and low CD24 ($CD44^{high}/CD24^{-/low}$) have the potential to depart the primary tumor site relatively early and form metastasis colonies at distant sites.

$CD44^{high}/CD24^{-/low}$ phenotype has been linked to EMT through the mesenchymal attributes of breast cancer stem cells, which also have dramatically enhanced malignant properties (Blick et al., Journal of Mammary Gland Biology and Neoplasia, 2010).

Different types of ionizing radiation

TARGiT® Academy

1) <u>Sparsely</u> ionising radiation: photons (γ- & X-rays), electrons

high energy low absorption ⇔ high penetrance

low energy high absorption ⇔ low penetrance

2) <u>Densely</u> ionising radiation: heavy particles

protons, neutrons

α-rays (atomic nucleus of Helium: He^{2+})
very high energy absorption
very low penetrance

Heavy ions, e.g. C-ions
moderate to very high energy absorption
moderate to very low penetrance

Radiation quality: ionisation density

Linear Energy Transfer (LET):
Mean energy deposited per track length
- measured in keV/µm

Photons, electrons: **low-LET**
typically **0.2-2 keV/µm**

10-40 keV photons: **4-6 keV/µm**

i.e. an order of magnitude lower than

Heavy particles: **high-LET**
typically **50-200 keV/µm**

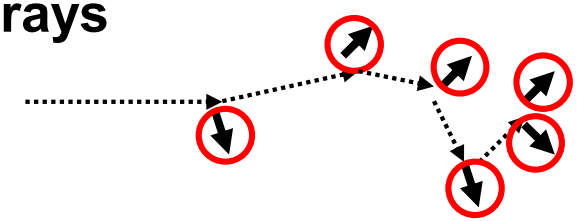
Idea adapted from Chapman & Gillespie (1981) & Wouters, Begg in „Basic Clin. Radiobiol.“ (2009)

Low-energy X-rays deposit a larger proportion of their dose in track ends

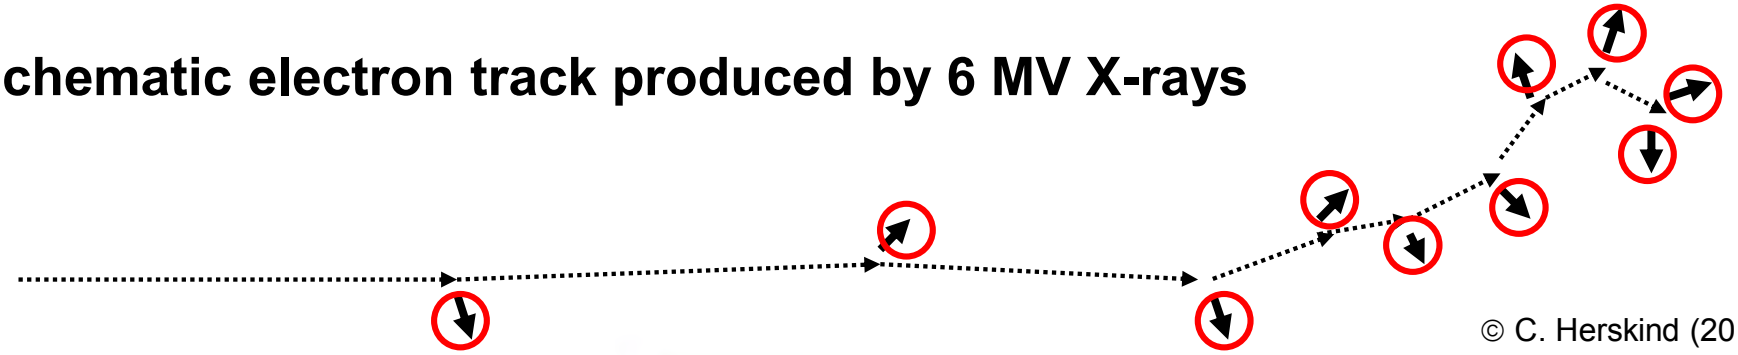
TARGiT® Academy

Electron track ends:

Schematic electron track produced by 50 kV X-rays



Schematic electron track produced by 6 MV X-rays



Courtesy of C. Herskind

Take home message (I)

- The radiation quality is characterized by the ionisation density: Linear Energy Transfer (LET)
- Track ends of fast electrons produce double strand breaks and complex lesions in DNA, most is repaired
- A small fraction of residual damage which cannot be repaired or is misrepaired are lethal
- Low-energy X-rays deposit a larger fraction of dose in track ends compared with high-energy X-rays

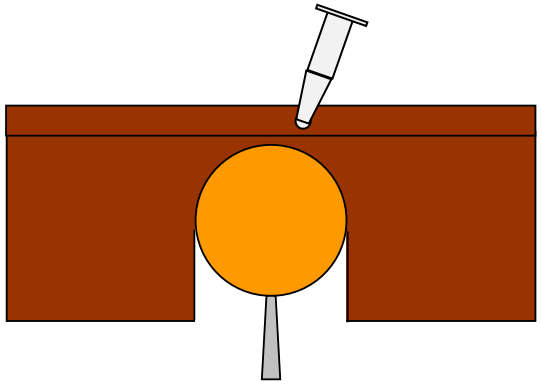
Hall & Giaccia„ Radiobiology for the Radiologist, 6th ed., 2006

RBE = ratio of physical doses producing same effect

$$RBE: D_{ref(MeV\ photons)}/D_{test}$$

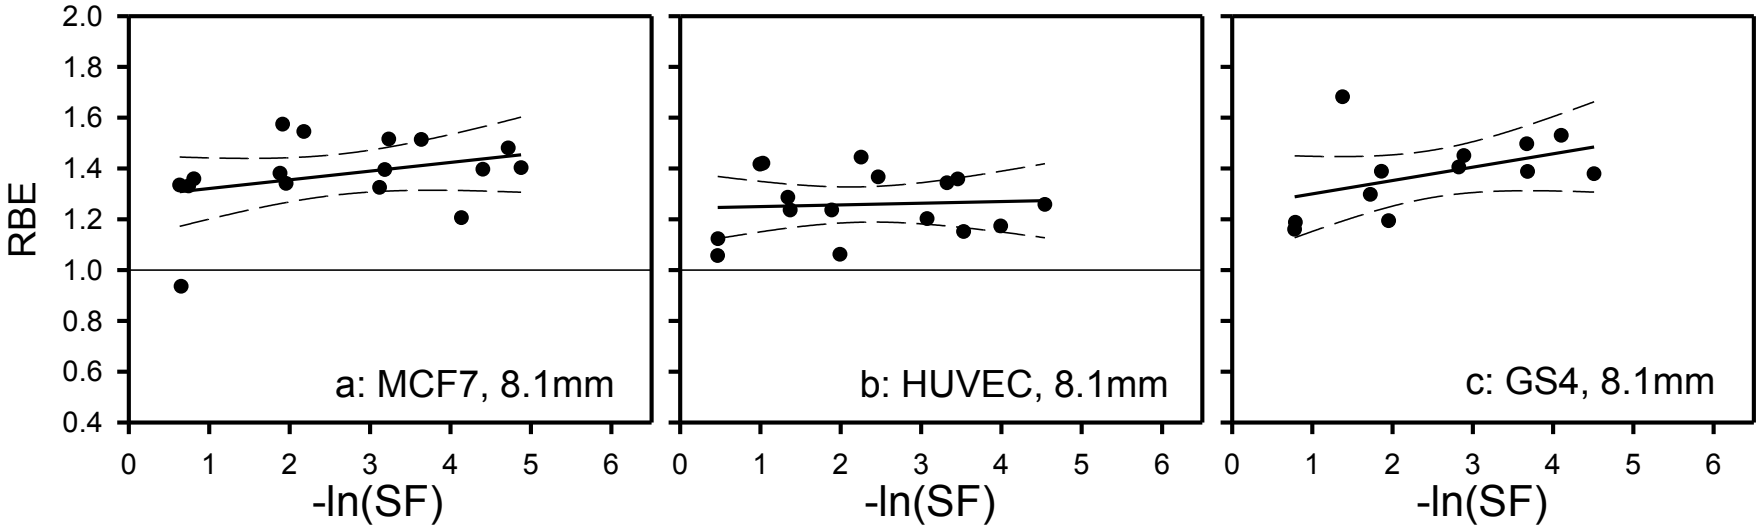
$$D_{ref} = RBE \times D_{test}$$

Experimental determination of RBE in tumour-bed phantom *in vitro*



Spherical breast applicator (4.0 cm diam.): RBE=1.35 [c.i. 1.2;1.5] in 8 mm distance from applicator surface (2.0 cm from source)

Liu et al.(2013), Int J Radiat Oncol Biol Phys 85:1127-33



Take home message (II)

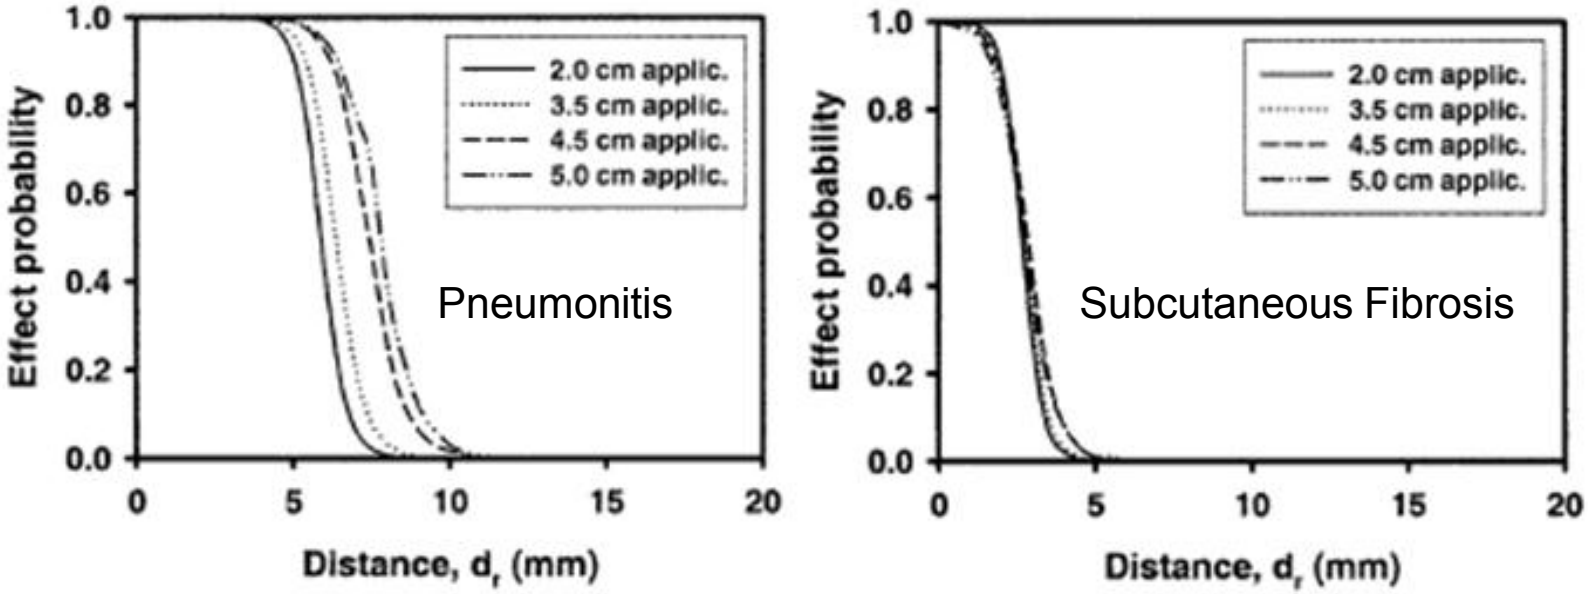
- The radiation quality affects the Relative Biologic Effectiveness (RBE)
- Theoretical and experimental evidence suggests enhanced RBE values in the range of 1.0 to 1.5

Estimates of Normal Tissue Effects and Risk of Recurrence

Modelling late effect probability as function of distance from the applicator

Herskind et al., Radiat. Res. 163 (2005)

Including the effect of recovery



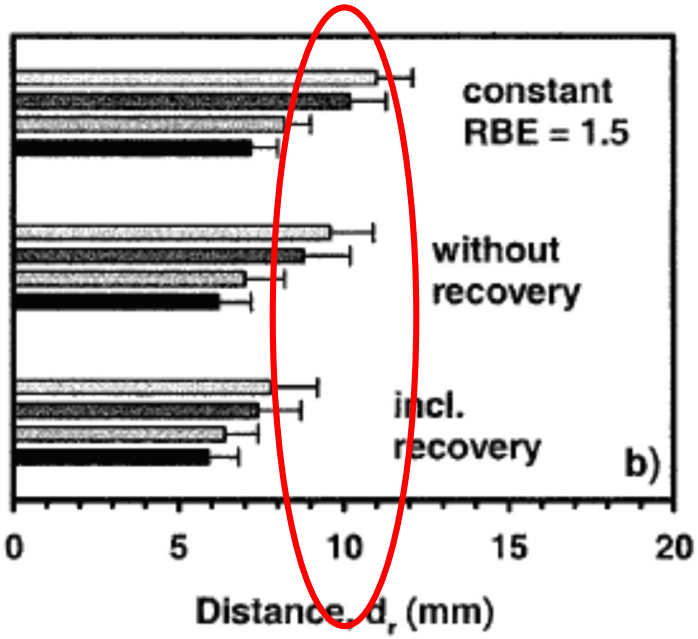
The curves are displaced away from the applicator surface and the displacement is greater for the larger diameters. ED_{50} is reached at 5.9-7.8 mm. The risk becomes negligible at larger distances (lung)

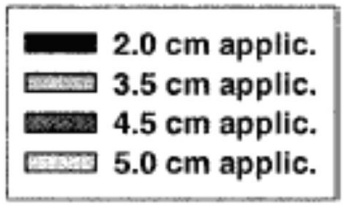
For different applicator diameters the probability of developing subcutaneous fibrosis is the same. This end point requires higher doses than pneumonitis, the volume at risk for developing fibrosis is smaller than that for pneumonitis

Estimated extent of late reaction under different assumptions for RBE

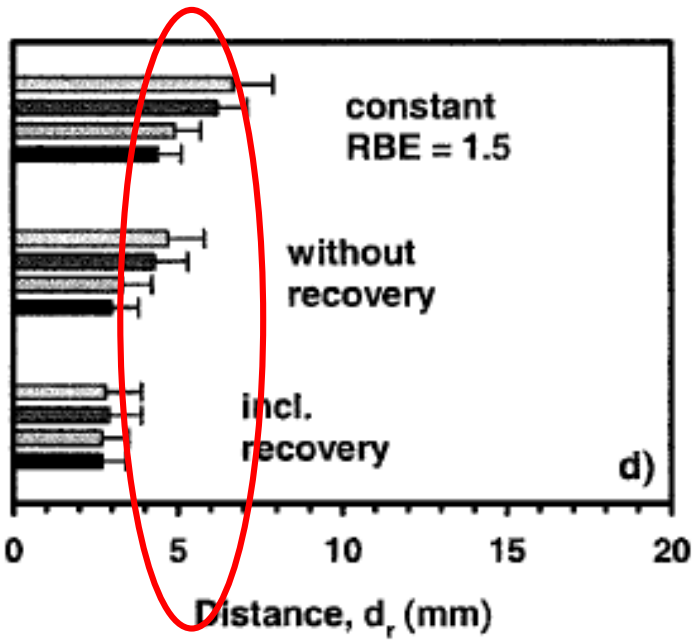
TARGiT® Academy

Pneumonitis





Subcutaneous Fibrosis



Pneumonitis is limited to ~ 10-12 mm distance even if RBE = 1.5

Thus the thorax wall offers sufficient protection of the lung

Epigenetic regulation of diacylglycerol kinase alpha promotes radiation-induced fibrosis

TARGiT® Academy

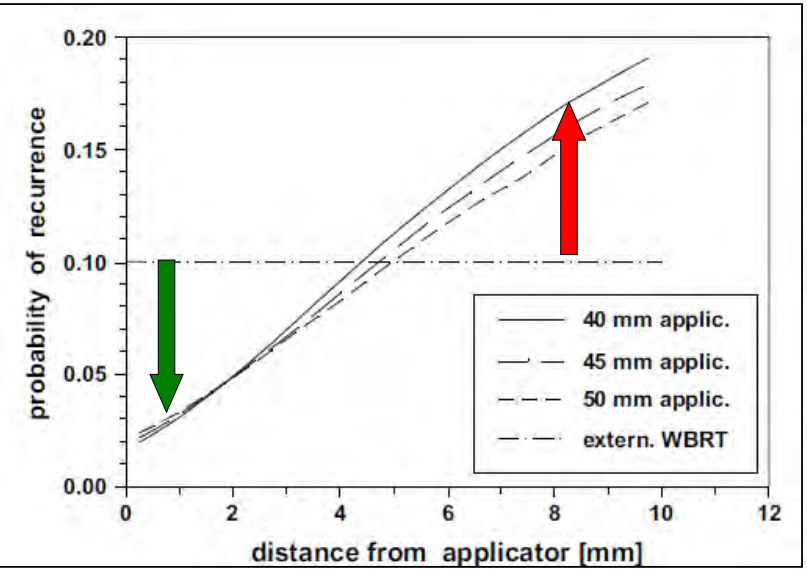
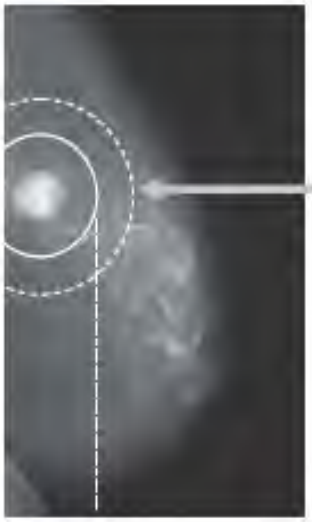
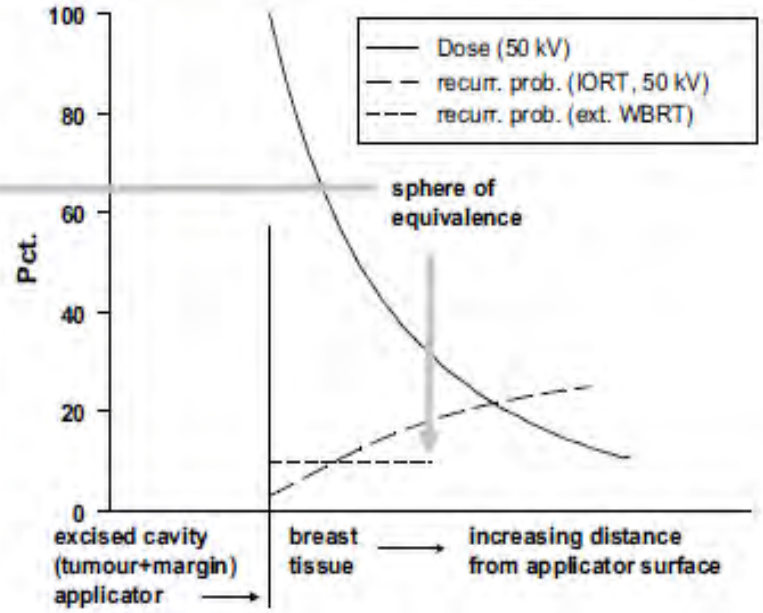
Risk of Local Recurrence: - "Sphere of Equivalence"

TARGIT® Academy







For IORT, the probability of recurrence increases as the absorbed dose decreases with depth in the tumour bed. For external beam RT, the probability is constant.

Sphere of equivalence in relation to excised tumour plus 10 mm margin. The relative dose and probability of recurrence are given on the y-axis as function of distance.

20 Gy single dose at the applicator surface ⟹ Equivalent Dose EQD2= 67.8-73.0 Gy Exceeds 50 Gy given in a standard course of external beam radiotherapy

High doses are better tolerated if the volume is small ("volume effect")

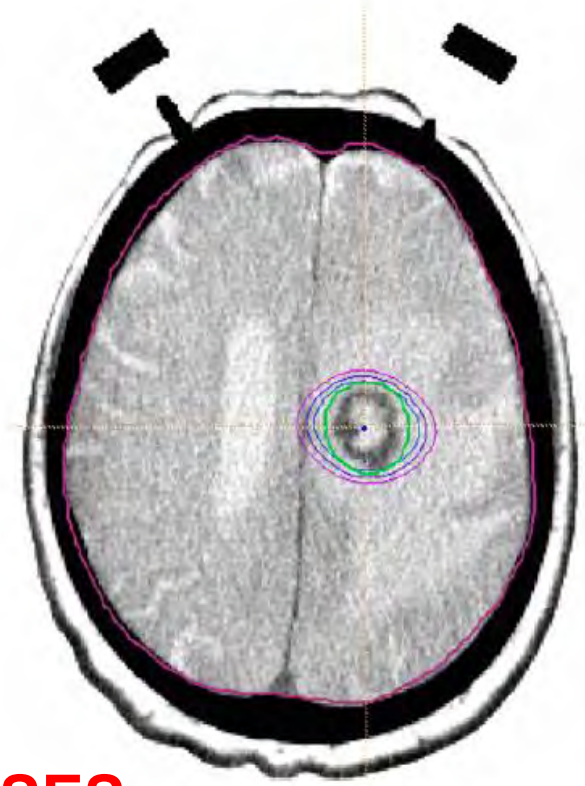
TARGiT® Academy

High dose to small volume:
radiosurgery (e.g. brain, liver, lung)

$$1-P=\prod_{i}\left\{\left[NTD_2(i)/NTD_2(D_{50})\right]^{k}+1\right\}^{-v(i)/V}$$

1-p	probability without necrosis
V	volume of brain
NTD	normalised total dose à 2 Gy
v(i)	volume receiving NTD
NTD2(D50)	NTD inducing 50% risk of necrosis

Flickinger 1989



BE CAREFUL WITH HIGH SINGLE DOSES:
VOLUME MATTERS!

Very large dose fractions have proved efficient in stereotactic body radiotherapy

TARGiT® Academy

Data from studies reviewed in Siva et al. (2010), J Thorac Oncol 5:1091-9
and Hoyer et al. (2012), Radiother Oncol 82:1047-57

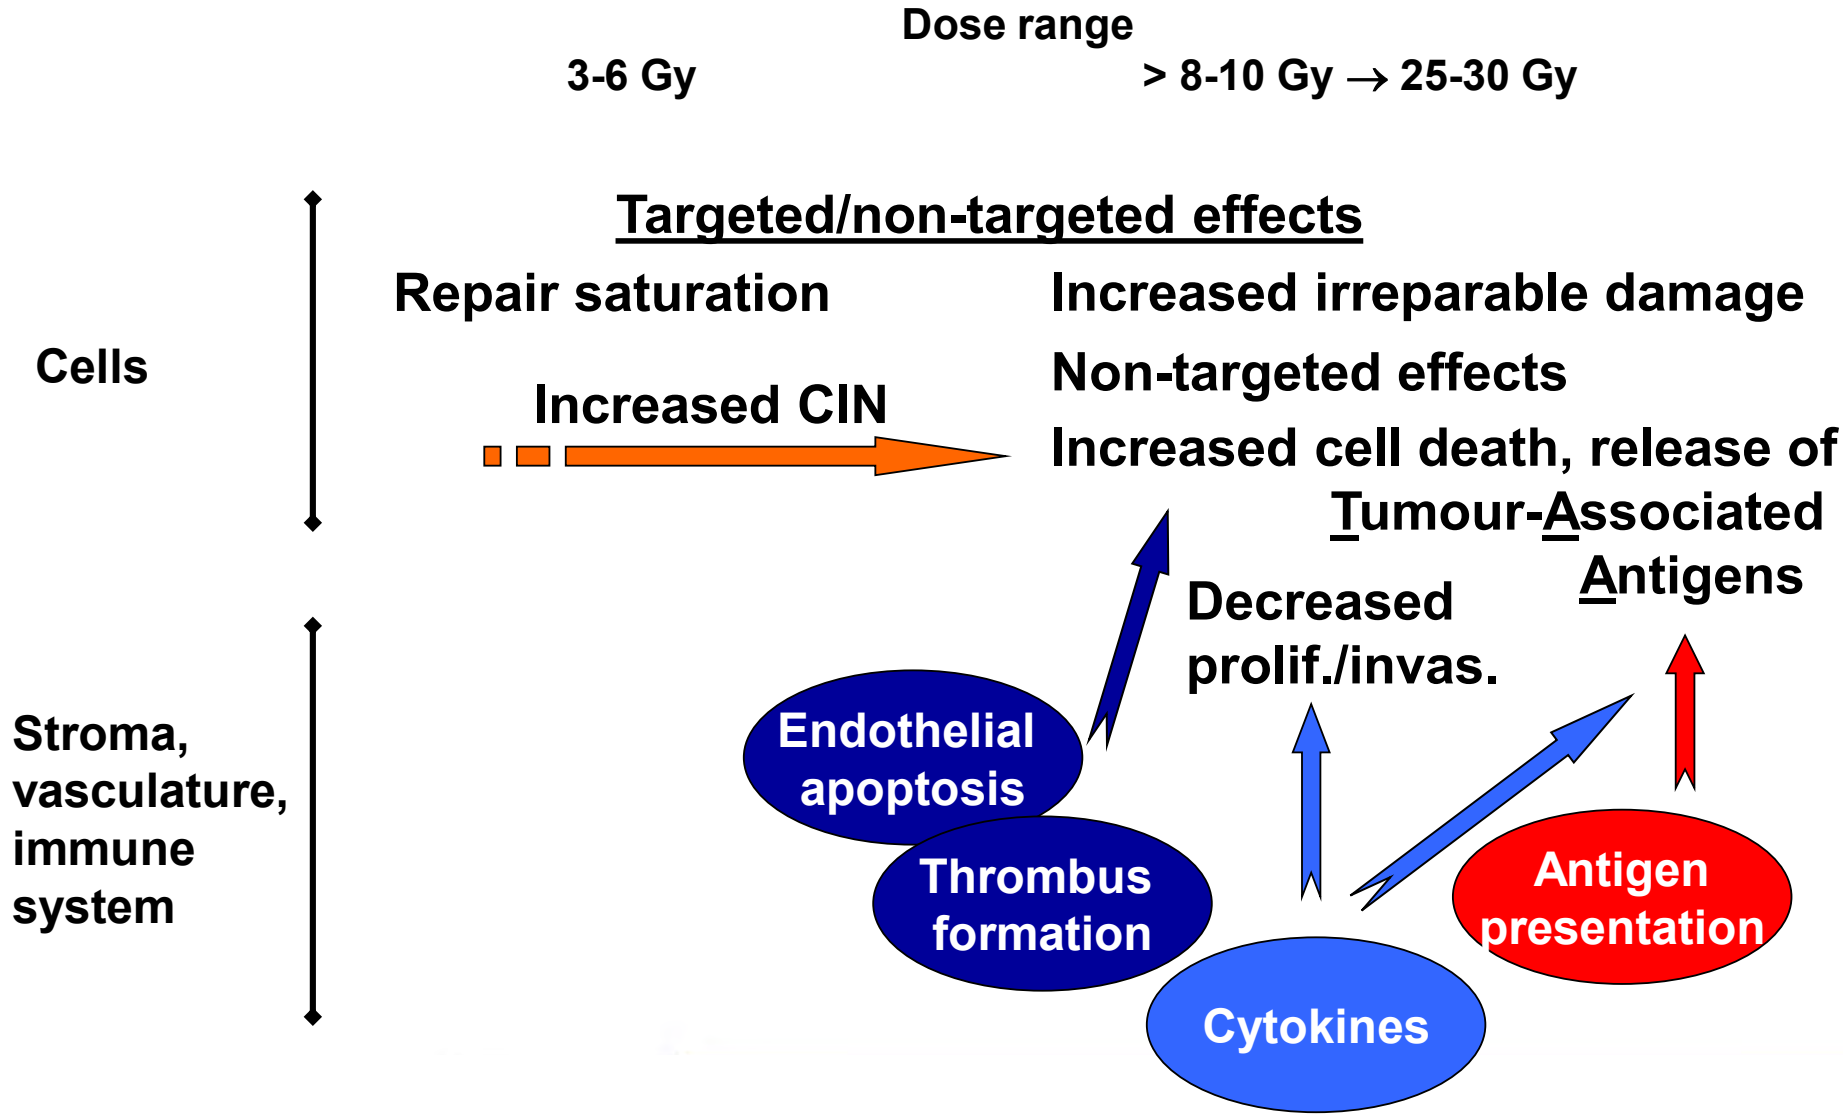
Model of potential biological effects of very large dose fractions



Herskind, Wenz (2014): Transl. Cancer Res. 3:3-17

Take home message (III)

- Modelling normal tissue reaction estimates
  - Pneumonitis limited to < 10-12mm dist. from applicator surface
  - Subcut. fibrosis limited to < 3-6mm dist. from applic. surface
- Modelling risk of recurrence predicts a „Sphere of equivalence“ for local control relative to EBRT
- Small volumes of normal tissue are able to tolerate higher radiation doses (volume effect)
- High single doses of RT may induce additional biological effects compared with daily dose fractions of 2 Gy

Courtesy of C. Herskind

Conclusions

- Increased RBE of low-energy photons (may be influenced by repair of sublethal damage during protracted irradiation: 30-50 min)
- Lack of fractionation
  - Irradiation at the time of surgery eliminates proliferation of residual tumour cells during the delay between surgery and radiotherapy, and between fractions during conventional radiotherapy
- Highly localized dose distribution: high dose to small volume
  - Radiobiological model suggests that the surviving fraction of the tumour cells at the applicator surface will be smaller than for whole-breast radiotherapy. This partly compensates the increase in cell survival at larger distances, predicting a **"Sphere of Equivalence"**
  - Late NT reaction is limited to a small volume (dose distribution). The high single dose is better tolerated in small volumes
- Biol. effects of high single doses (nontargeted/vascular/ immune)

Worldwide Technical and Clinical Review of Mobetron Usage

Presented at 9th International ISIORT Conference

June 2016

IntraOp Mobetron: Integrating Radiation and Surgical Oncology

Optimized for the OR

- Portable and Self-Shielded
- Soft Docking Laser Alignment System
- Treatment Time: 2 Minutes

Established Radiation Technology

- Over 70,000 Patients Treated Clinically
- Traditional Electron Energies (6, 9, 12 MeV)
- Accurate & Uniform Dosimetry

Improved Patient Results

- Right Dose, Right Depth, Right Volume
- Shorter Treatment Cycle
- Lower Overall Dose
- Minimal Impact to Healthy Tissue

Leading Institutions in 16 Countries Utilize Mobetron to Improve Patient Care

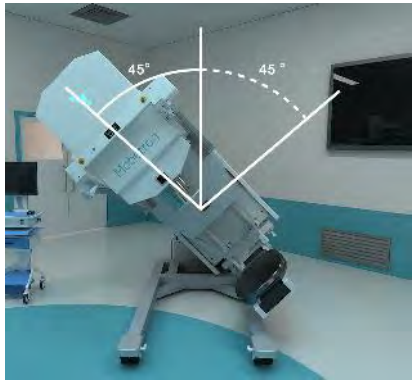
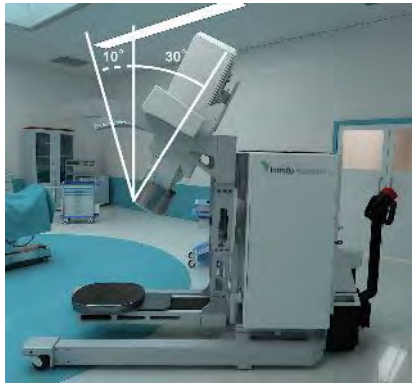
IntraOp Mobetron

World's Only Self-Shielded Mobile Electron IORT Device





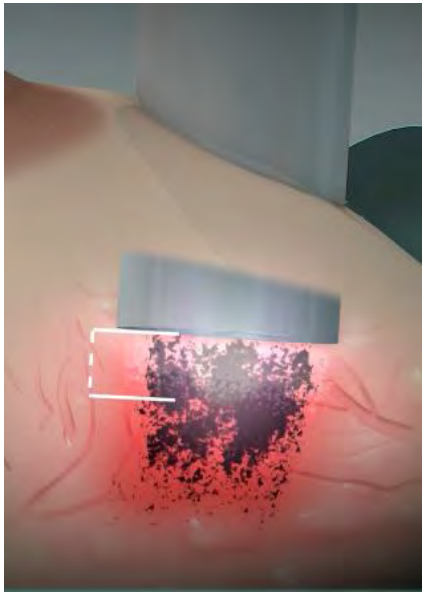
Key Features

- **Energies: 6, 9, 12 MeV**
- **Depth: 1-4 cm D_{80}**
- **Shielding: less than 6µSv @ 3 meters**
- **Motion Control:**
  - **Rotation: +/- 45º, Tilt +10º / - 30º**
  - **Lateral/Longitudinal: +/- 5cm:**
- **Soft docking laser alignment system**
  - **Ensures accuracy and safety**
- **Touch Screen Console**
  - **Intuitive, Real-Time Control and Diagnostics**
- **Simple Daily QA System**
  - **AAPM TG72 Compliant**

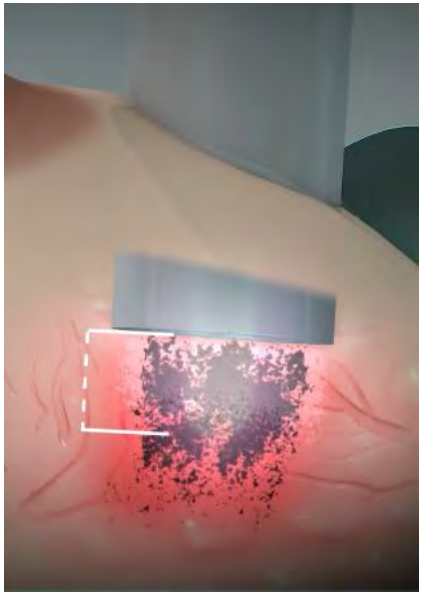
The Mobetron

Delivers the Right Dose at Right Depth for the Right Volume

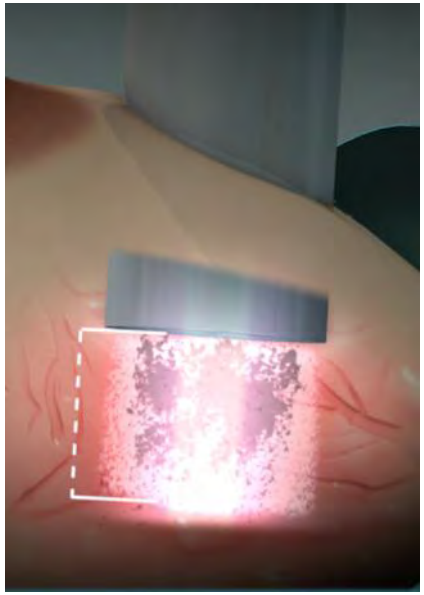
Depth of Penetration in tissue or muscle



6 MeV
Depth: 2cm (D80)



9 MeV
Depth: 3cm (D80)



12 MeV
Depth: 4cm (D80)

2 year output variation < 1.5%

2-year energy variation, < 1 mm

Mobetron

Proprietary Technology Minimizes Size and Stray Radiation

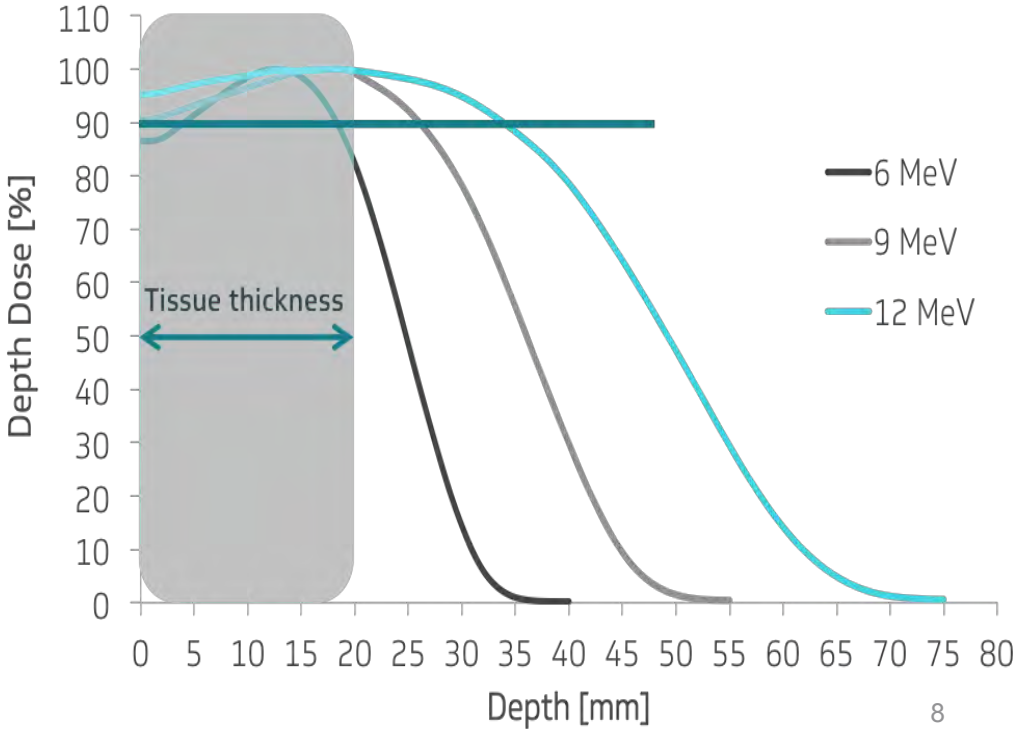
- X-Band Technology Shrinks the Size by 66%
- Low Beam Current Reduces Leakage
- “Sculpted” Shield around Accelerator Eliminates Bend Magnet
- Fixed Collimator Reduces Stray X-rays
- Integrated Beam Stopper

Applicator and Clamping Solutions Ensure Precise Treatment

- **Metal Applicators:**
  - Diameter: 3 – 10 cm (5mm Increments)
  - Length: 30 cm
  - Angles: 0º, 15º, 30º, 45º
  - Thickness: 2mm
  - Standard Steam Sterilization
  - Low Leakage
  - Custom Applicators Available (ie. Sarcoma)
- **Clamps:**
  - Standard All Metal Clamp
    - Easily Sterilized
    - Ratchets for Quick and Firm Positioning
  - Pneumatic Arm Clamp
    - Easy one hand positioning

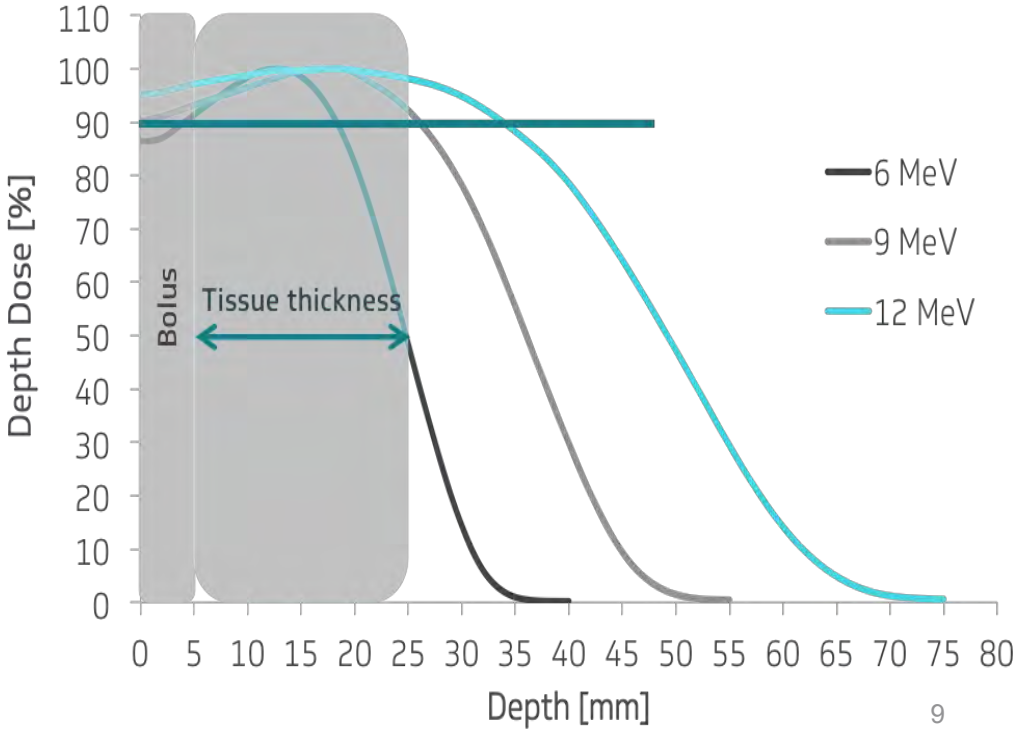
Clear Boluses for Treatment Flexibility

- **Boluses:**
  - 5mm & 10mm Thickness
  - Increases Surface Dose for Lower Energies
  - Flexible Penetration Depth (5 mm Increments)
  - Ensures Uniform Tissue Surface



Clear Boluses for Treatment Flexibility

- **Boluses:**
  - 5mm & 10mm Thickness
  - Increases Surface Dose for Lower Energies
  - Flexible Penetration Depth (5 mm Increments)
  - Ensures Uniform Tissue Surface



Electron IORT Improves Local Control in Virtually Every Tumor Site

Breast Cancer

- WBI with Boost
- APBI Single Fraction

Over 30,000 Patients Treated with Electron IORT

Locally Advanced or Recurrent Cancers

- Pancreatic
- Colorectal
- GYN
- Head & Neck
- Extremity Sarcoma
- Retroperitoneal Sarcoma

Over 35,000 Patients Treated with Electron IORT

Emerging Indications

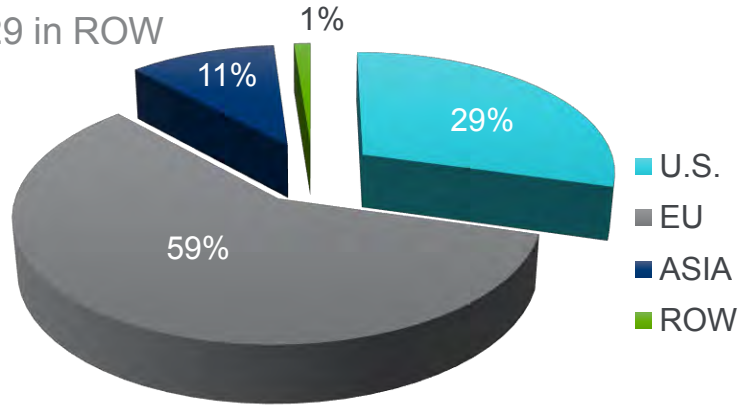
- Lung
- Pediatric
- Prostate
- Bladder
- Gastric
- Esophageal
- CNS
- Others

- Mature and Robust Data
- Robust Data

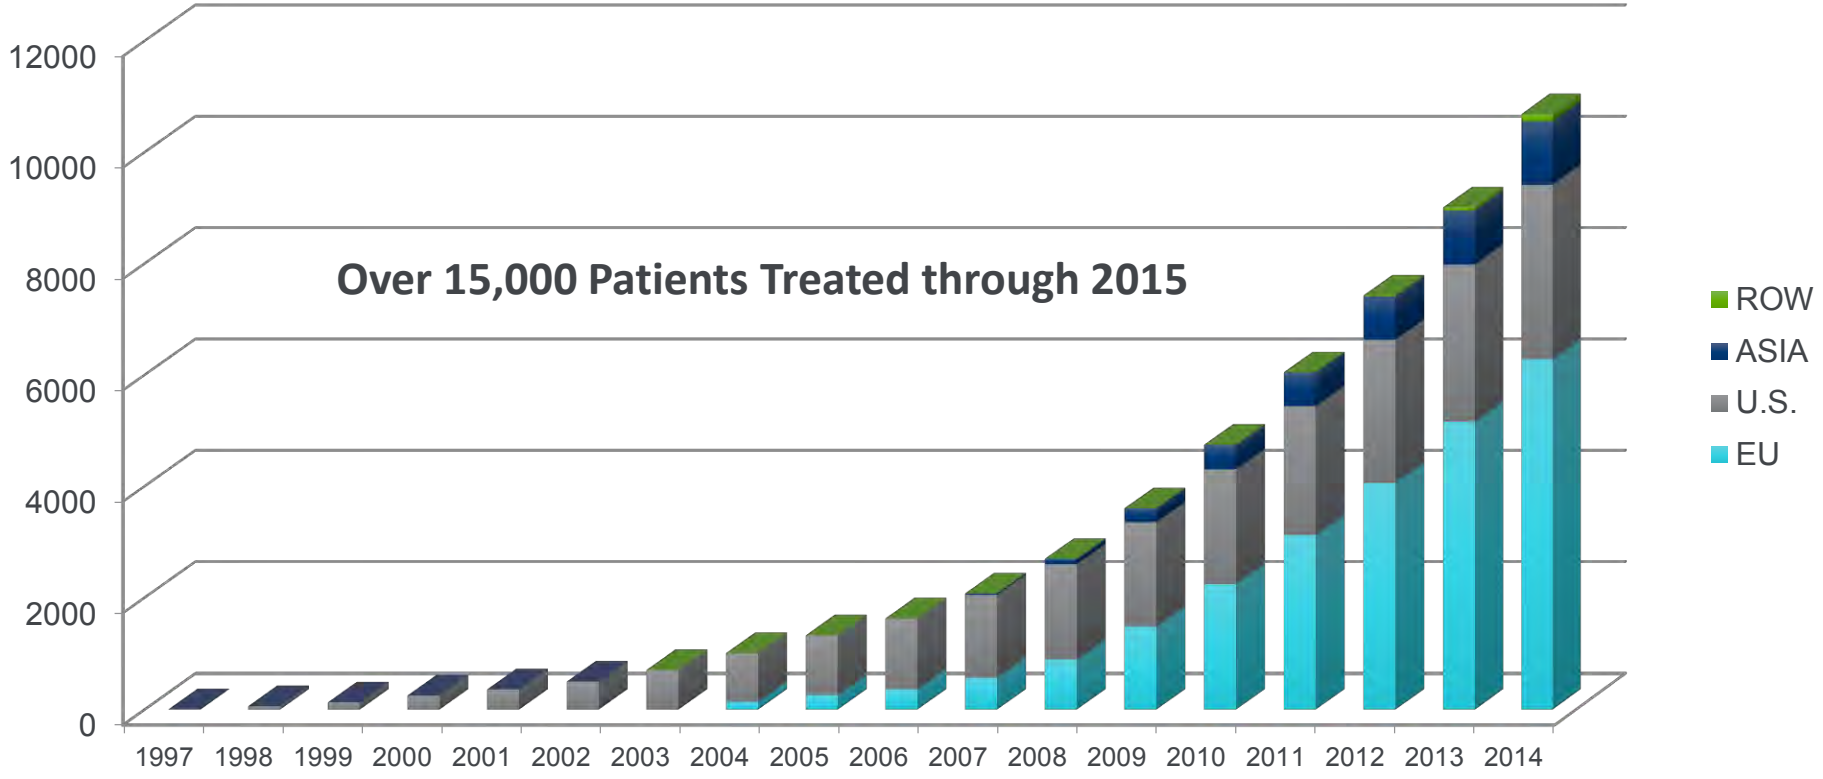
Introduction

- Contacted 54 Mobetron users in 14 countries, who were in clinical operation prior to December 31, 2014.
- 50 Centers provided complete or partial responses or expressed their interest to do so.
- We can estimate that at these 50 centers around 10,683 patients have been treated (by the end of 2014)
  - 6,276 in Europe, 3,136 in the U.S., 1,142 in Asia and 129 in ROW

When includes 2015 and missing centers, we can conservatively estimate that over 15,000 patients have already been treated with the Mobetron.



Cumulative Growth of Total Mobetron Cases, Worldwide

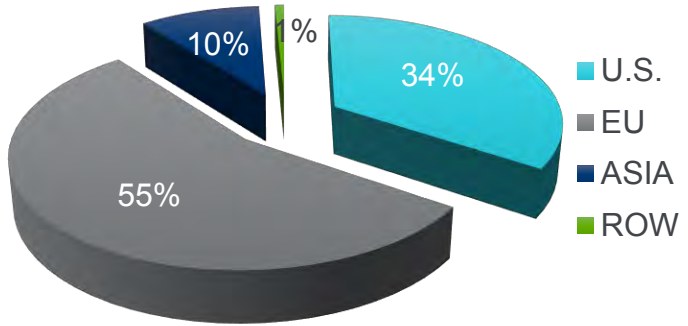


Source: IntraOp Mobetron User Database (~80% of Active Users)

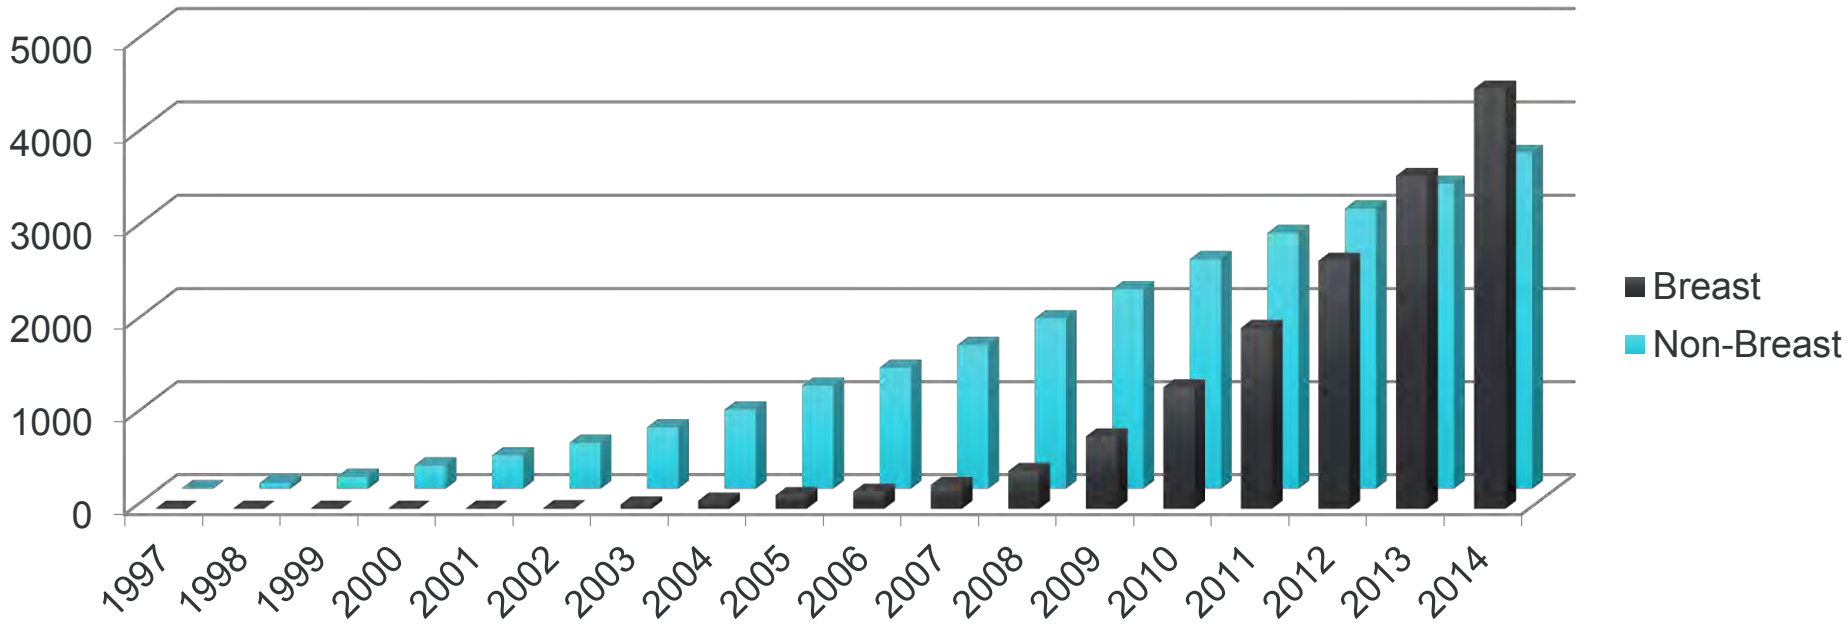
Treatment Data Characteristics

- For data received:
  - Out of 10,683 patients treated, a total of 8,111 patients were analyzed of which 4,508 (56%) were treated for breast.
  - In Europe: 4,456 patients were analyzed of which 3,680 (83%) were breast.
  - In the U.S.: 2,790 patients were analyzed of which 557 (20%) were breast.
  - In Asia: 805 patients were analyzed of which 267 (33%) were breast.
  - In ROW: 60 patients analyzed of which 4 (7%) were breast.

Distribution of analyzed data



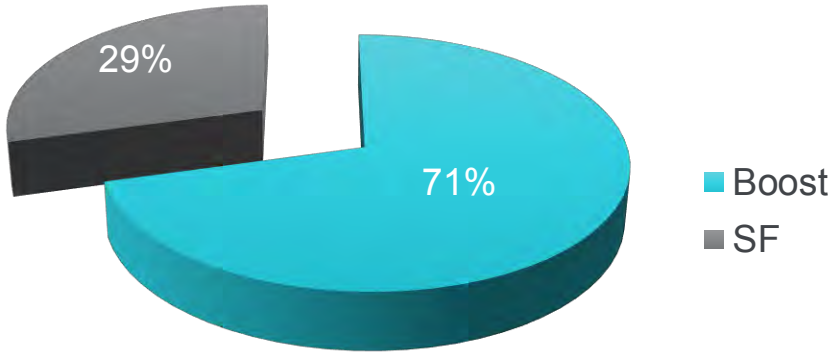
Cumulative Growth of Analyzed Mobetron Cases, Worldwide



Breast

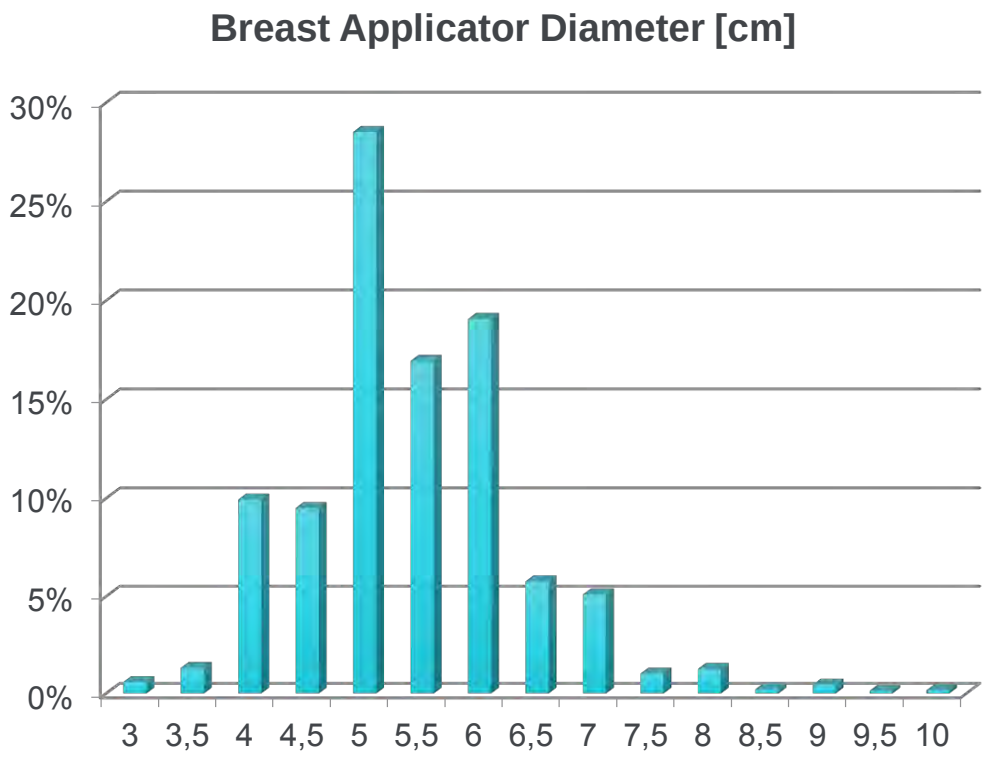
Breast data characteristics

- For the breast data received:
  - 71% of breast patients were treated as a boost (75% EU, 72% U.S., 16% Asia).
  - 29% of boost treatments followed by 3 weeks EBRT.
  - 48% were treated at 9 MeV; 26% at 6 MeV; and 24% at 12 MeV (2% @ 4 MeV).



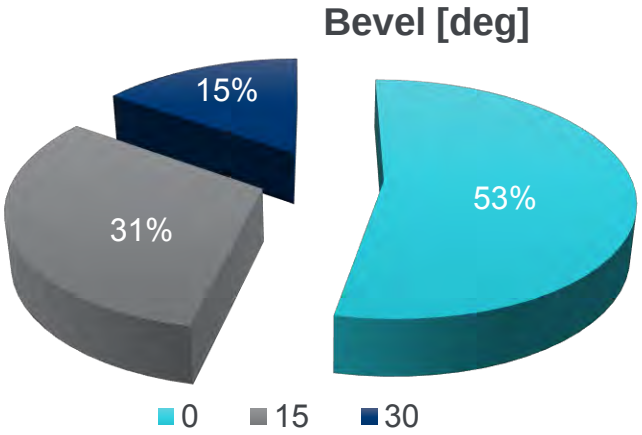
Breast data characteristics (continued)

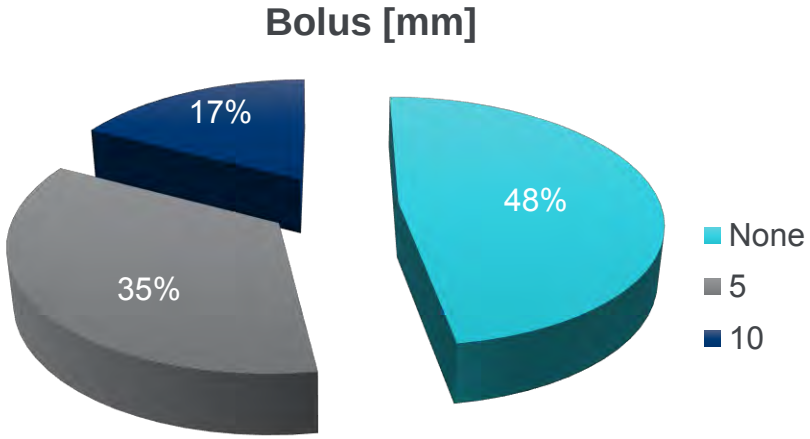
- For the breast data received:
  - 84% of patients were treated with FS between 4-6 cm.
  - 35% of patients were treated with a ½ cm sized applicator.
  - 3% of patients were treated with a FS > 7 cm.



Breast data characteristics (continued)

- For the breast data received:
  - 53% treated with 0° bevel, 31% with 15° bevel; and 15% with 30° bevel.
  - 52% used bolus; 5 mm bolus was used 2x as often as the 10 mm bolus
  - 54% used Chest-Wall Protectors (in 81% SF & in 37% Boost treatments)

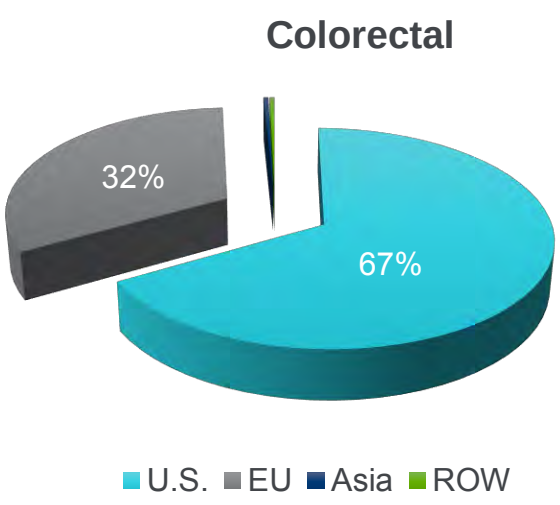


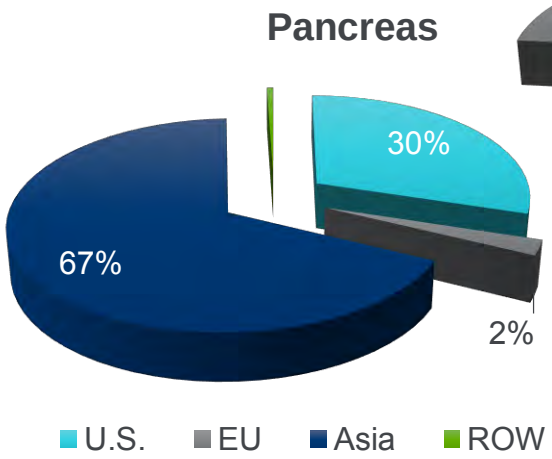


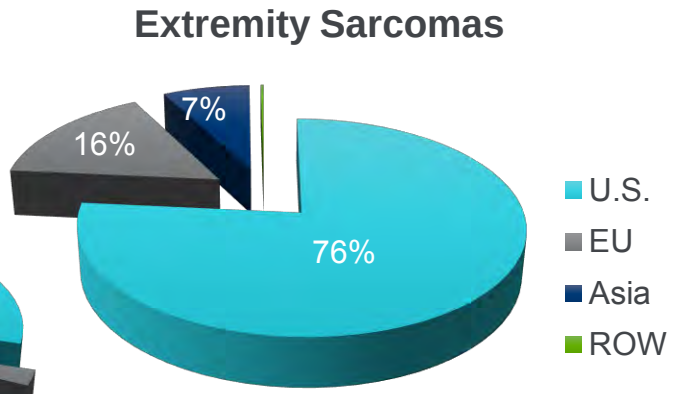
Non-Breast

Non-Breast Data characteristics

- For Non-breast data main sites were: Colorectal (21%), Pancreas (15%), Extremity Sarcomas (22%) and RPS (8%).

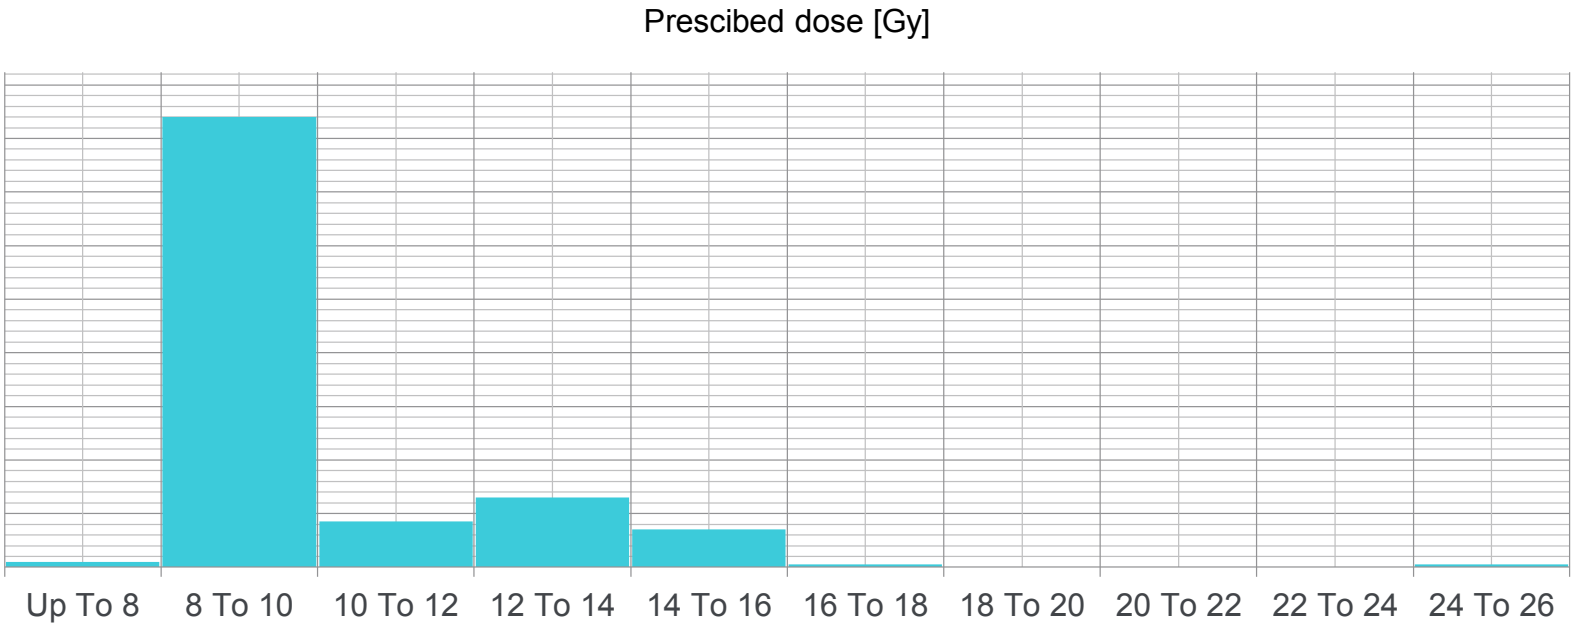






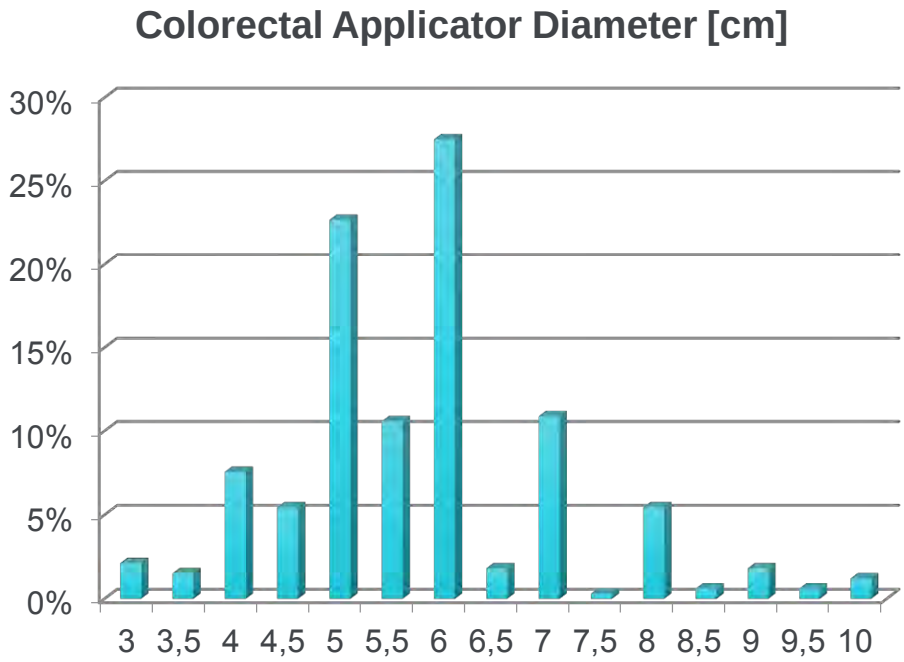
Colorectal data characteristics

- For the colorectal data received:
  - 50% were treated at 9 MeV; 35% at 6 MeV; and 10% at 12 MeV (5% @ 4 MeV).



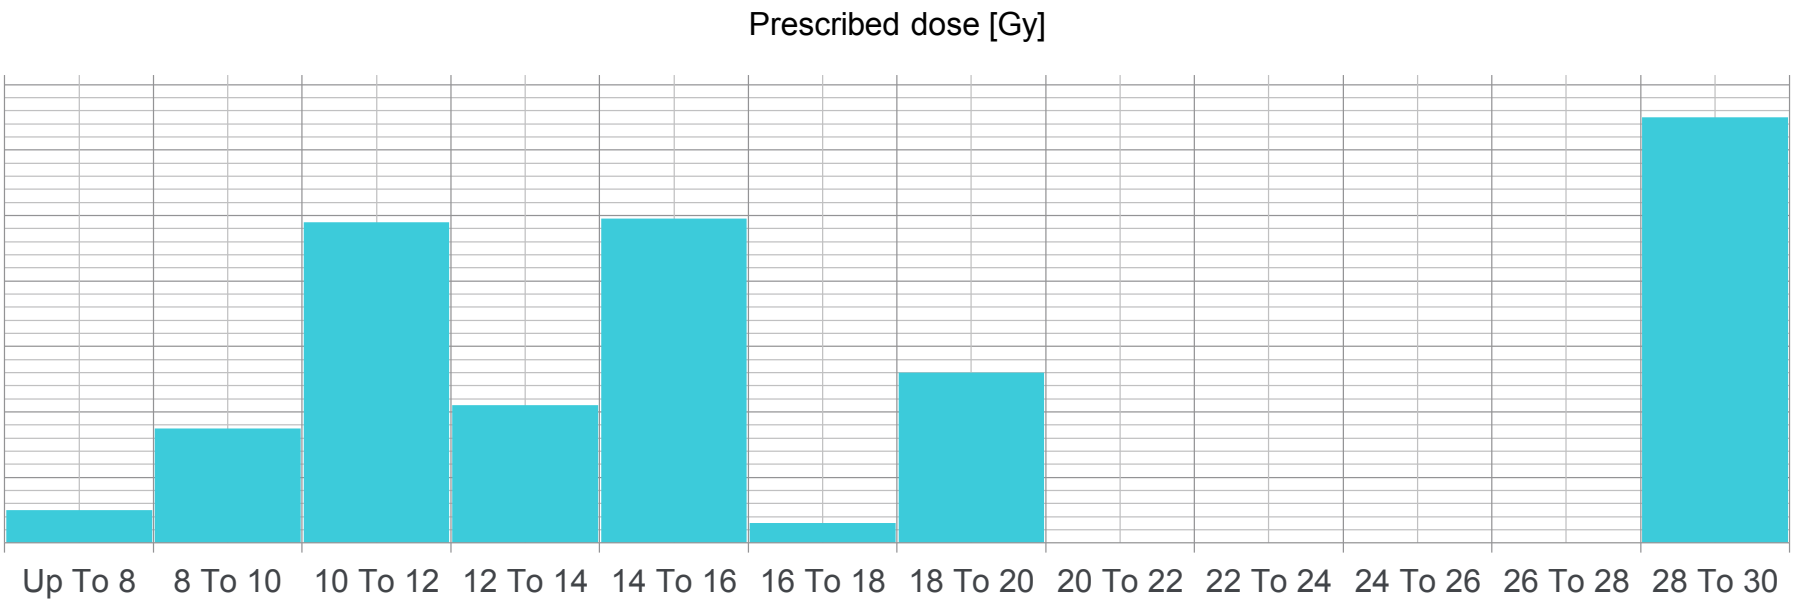
Colorectal data characteristics (continued)

- For the colorectal data received:
  - 86% of patients were treated with FS between 4-7 cm.
  - 21% of patients were treated with a ½ cm sized applicator.
  - 88% treated with 30º bevel and 4% with 15º bevel.
  - 41% used bolus; 5 mm bolus was used 2x as often as the 10 mm bolus.



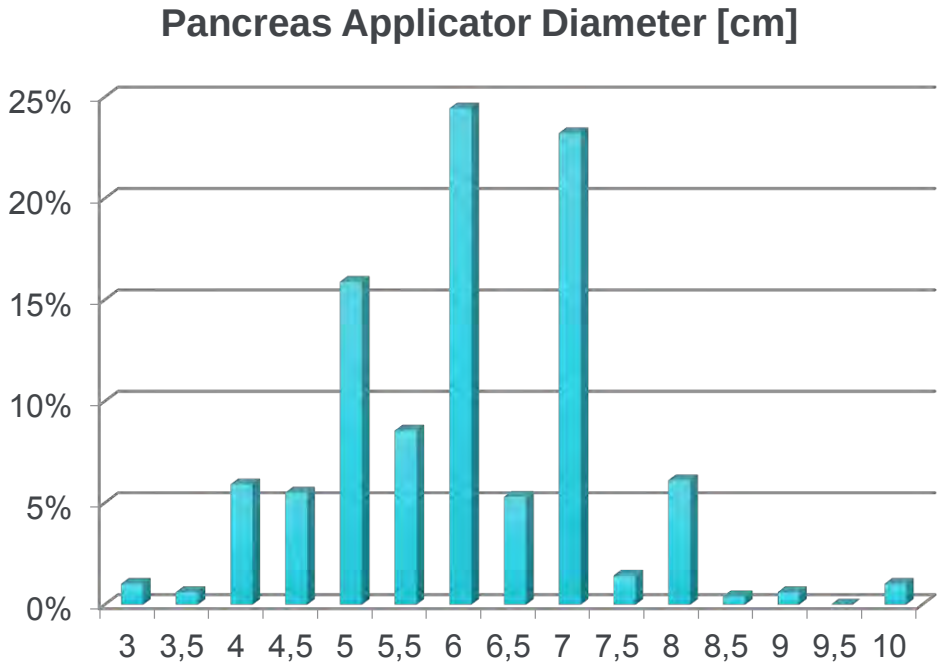
Pancreas data characteristics

- For the pancreas data received:
  - 49% were treated at 12 MeV; 26% at 9 MeV; and 24% at 6 MeV (1% @ 4 MeV).



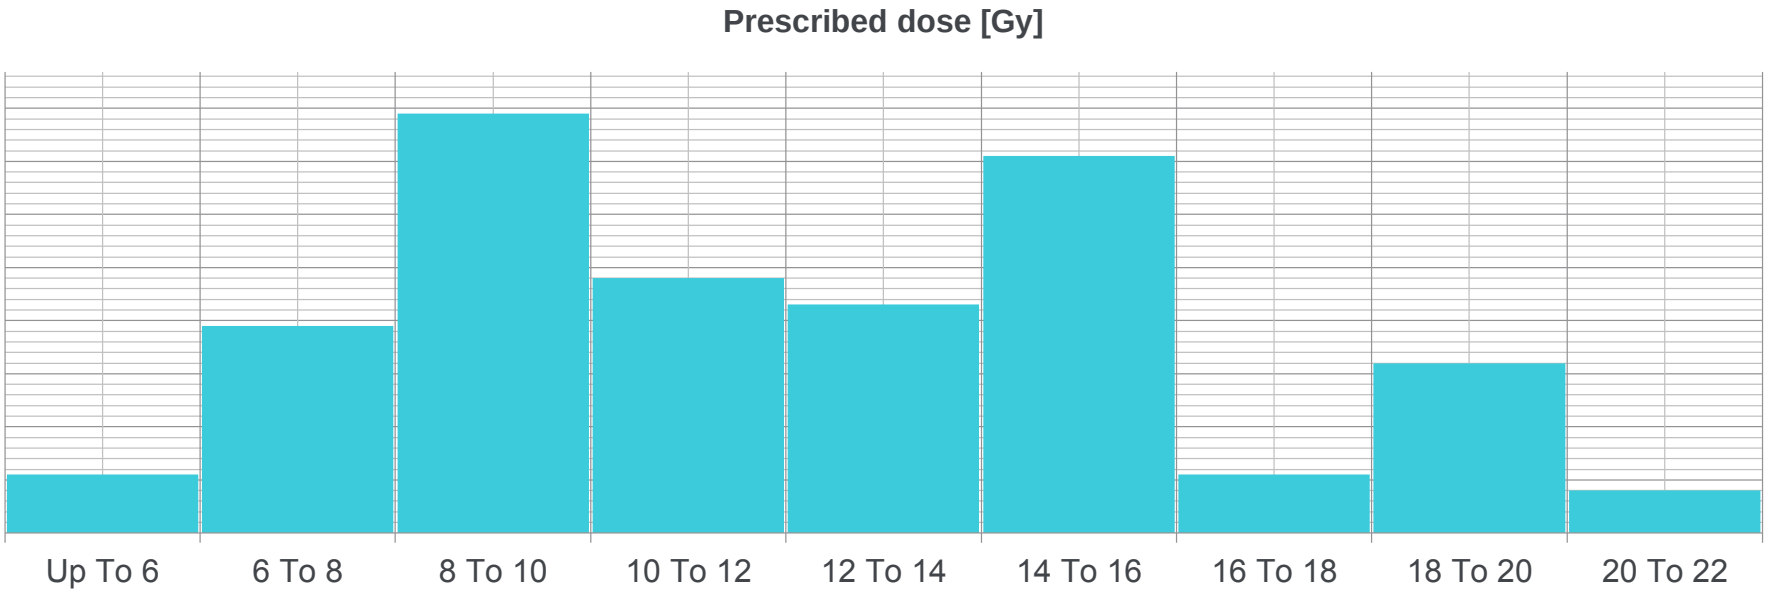
Pancreas data characteristics (continued)

- For the pancreas data received:
  - 77% of patients were treated with FS between 5-7 cm (53% FS 6 - 7cm).
  - 22% of patients were treated with a ½ cm sized applicator.
  - 73% treated with flat applicator. 15º and 30º bevel used in 12% and 16% cases respectively.
  - In 92% cases no bolus used.



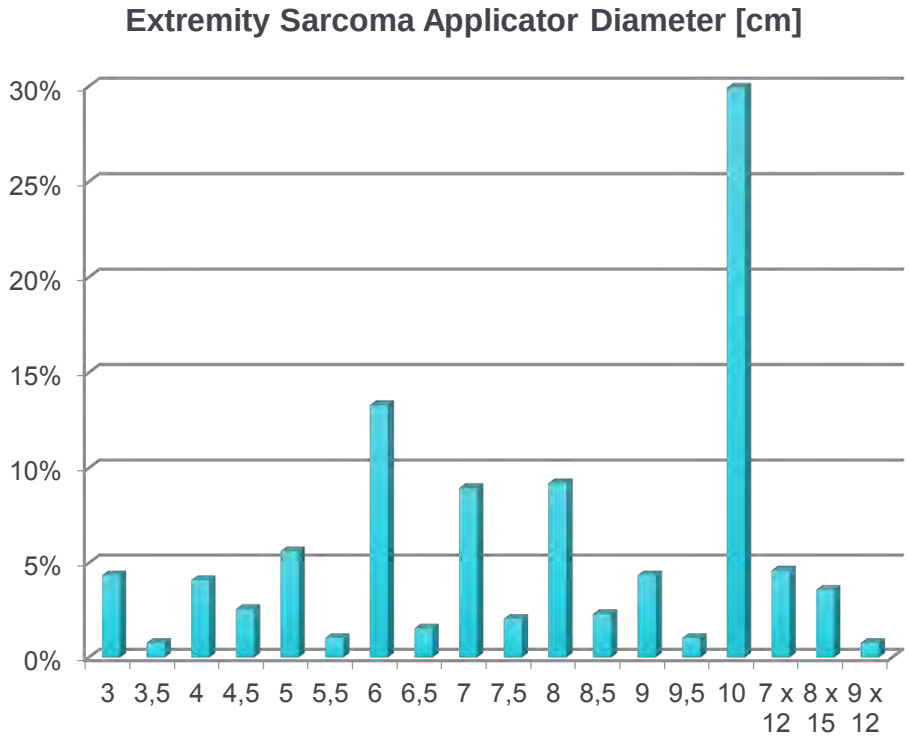
Extremity Sarcoma data characteristics

- For the extremity sarcoma data received:
  - 46% were treated at 9 MeV; 45% at 6 MeV; and 8% at 12 MeV (1% @ 4 MeV).



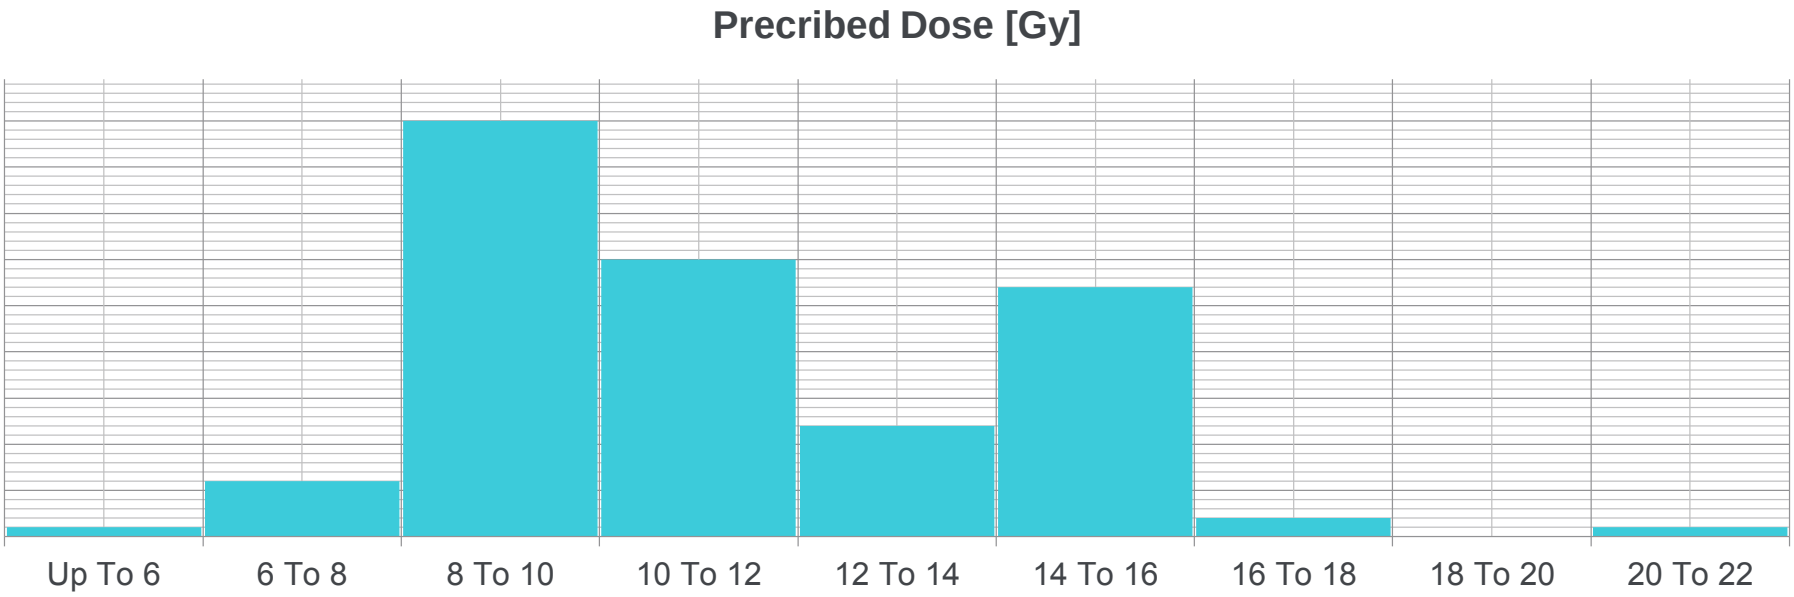
Extremity Sarcoma data characteristics (continued)

- For the extremity sarcoma data received:
  - 30% of patients were treated with 10 cm applicator.
  - In 13% cases more than one field required to cover the target.
  - Dedicated ‘sarcoma’ applicators used in 10% treatments.
  - 12% of patients were treated with a ½ cm sized applicator.
  - 39% treated with flat applicator. 15^{o} and 30^{o} bevel used in 13% and 48% cases respectively.



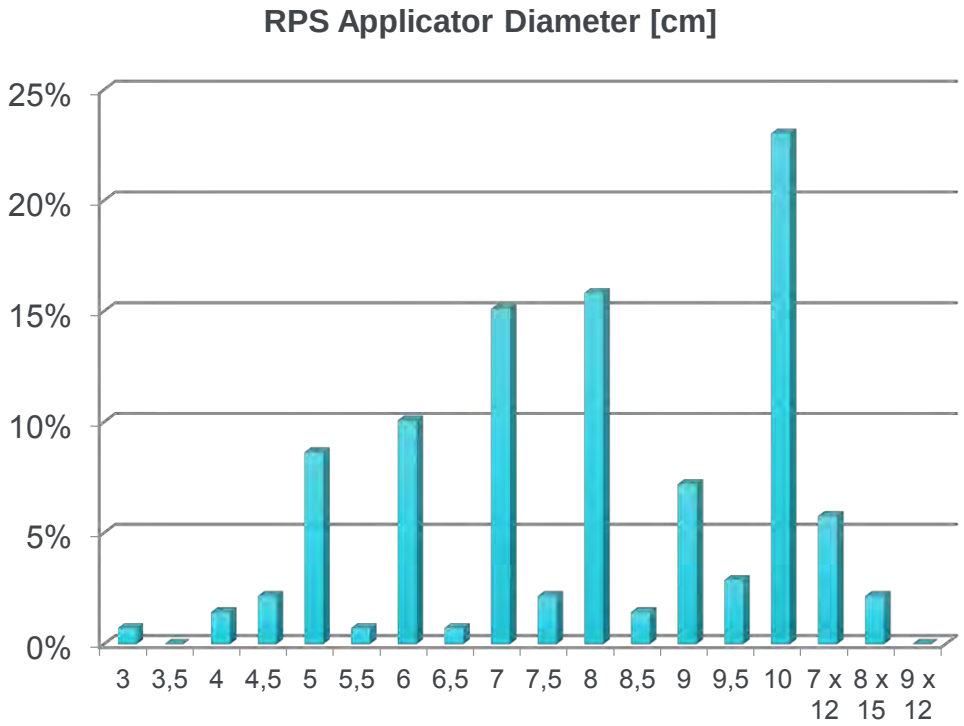
RPS data characteristics

- For the RPS data received:
  - 58% were treated at 9 MeV; 22% at 6 MeV; and 19% at 12 MeV (1% @ 4 MeV).



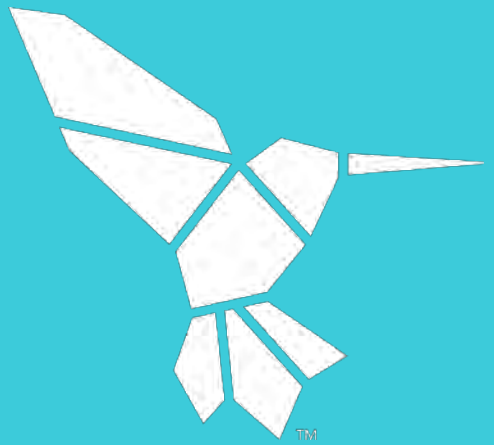
RPS data characteristics (continued)

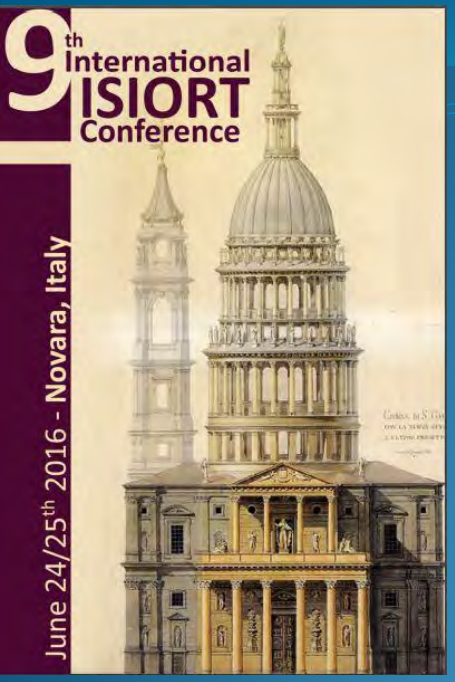
- For the RPS data received:
  - 23% of patients were treated with 10 cm applicator.
  - In 14% cases more than one field required to cover the target.
  - Dedicated ‘sarcoma’ applicators used in 8% treatments.
  - 11% of patients were treated with a ½ cm sized applicator.
  - 34% treated with flat applicator. 15^{o} and 30^{o} bevel used in 8% and 58% cases respectively.



Treatment Application Characteristics

Tumor	Energy [MeV]			Applicator diameter [cm]	Bevel [deg]			½ cm sized applicators
	6	9	12		0	15	30	
Breast	26%	48%	24%	4 – 6 (84%)	53%	31%	15%	35%
Colorectal	35%	50%	10%	4 – 7 (86%)	8%	4%	88%	21%
Pancreas	24%	26%	49%	5 – 7 (77%)	73%	12%	16%	22%
Sarcoma-Extremity	45%	46%	8%	10 (30%)	39%	13%	48%	12%
Sarcoma-RPS	22%	58%	19%	10 (23%)	34%	8%	58%	11%





A real time in vivo dosimeter integrated in the radiation protection disk for IORT breast treatment

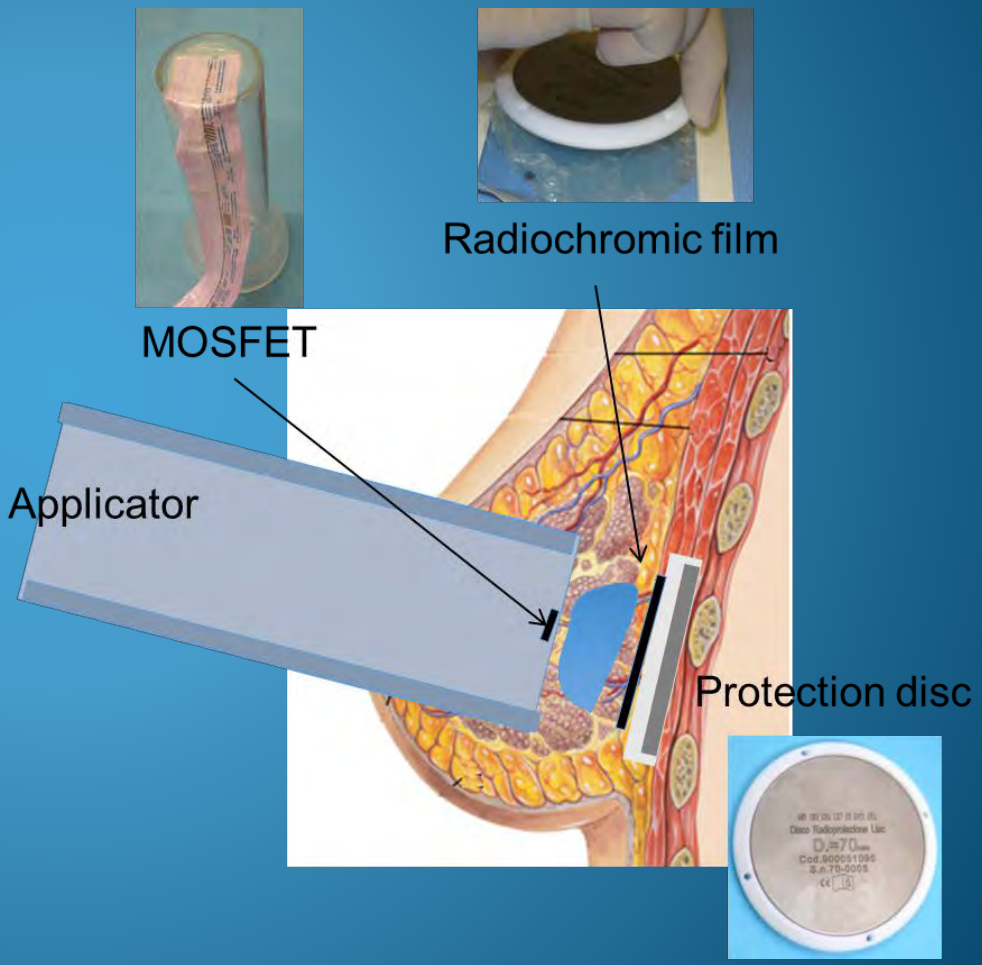
[1]G. Felici, [2]M. Iori , [3]A. Montanari , [3]N. Tosi,
[2]E. Cagni, [2]A. Botti, [1]A. Ciccotelli, [4]L. Strigari

1)Sordina IORT Technologies Spa, Aprilia, Italy
2) S. Maria Nuova Hospital - IRCCS, Reggio Emilia, Italy
3) National Institute of Nuclear Physics - Section of Bologna, Italy
4) National Cancer Institute Regina Elena, Roma, Italy

SIT

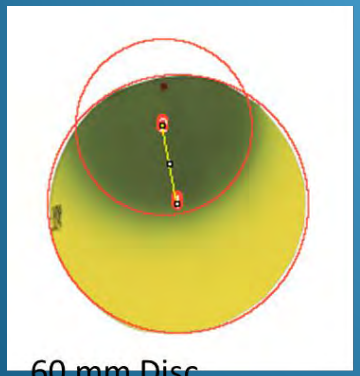
IORT: current practice with linacs

- An electron beam (4-12 MeV) is delivered in one session by a mobile LINAC.
- A protection disc is inserted under tissue to be treated.
- The correct alignment of the protection disc is verified by surgeon by touch when the disc is no more visible.
- The entrance dose is measured in *one point* (MOSFET) at applicator output.
- The dose delivered to the target is measured *offline* (radiochromic film) above the protection disc.

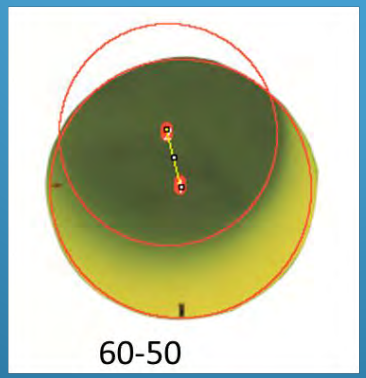


Critical points

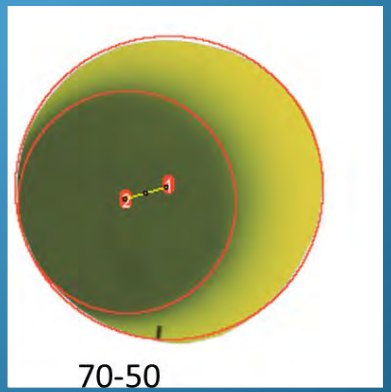
- The blackened area of the gafcromic film also allows to check the centering of the protections disc during the IORT treatment delivery.
- The monitoring of the dose on the target is done in one or two points just at the end of the treatments (MOSFET) or hours, on the entire beam region, by the end of treatment session. This could causes uncertainties on the dose delivered to tissue during the treatment.
- Healthy tissues that are posed under the target (ribs, lung, etc..) need to be protected, but correct positioning of the protection disc is verified .. when it is too late & the fraction of acceptable alignments is far from 100%. Some examples of wrong alignment:



60 mm Disc
40 mm Applicator

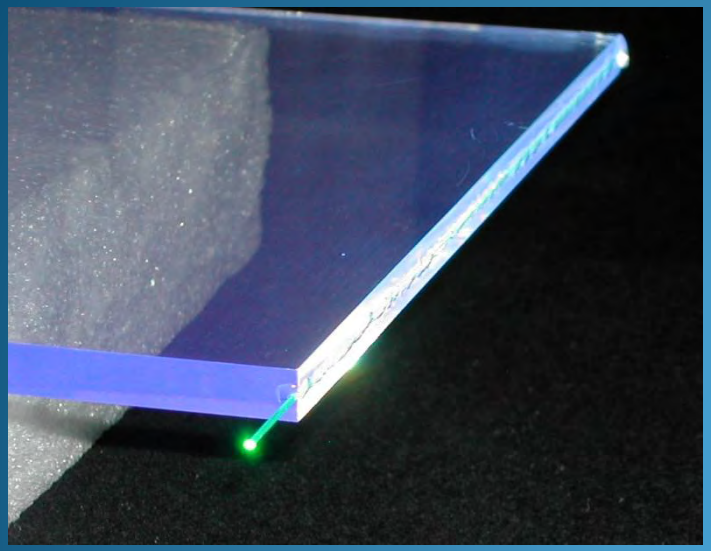


60-50



70-50

Plastic scintillator



- Cast sheet of polyvinyl toluene or polystyrene doped with organic scintillating molecules;
- emits violet light proportionally to the dose deposited in the detector volume;
- light collection with Wave Length Shifting (WLS) fiber (green light);
- WLS fiber coupled to photodetector.

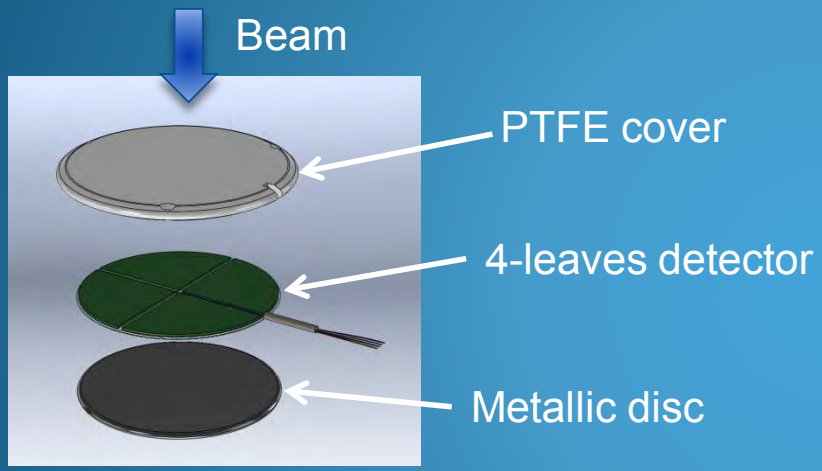
–**Main properties**:

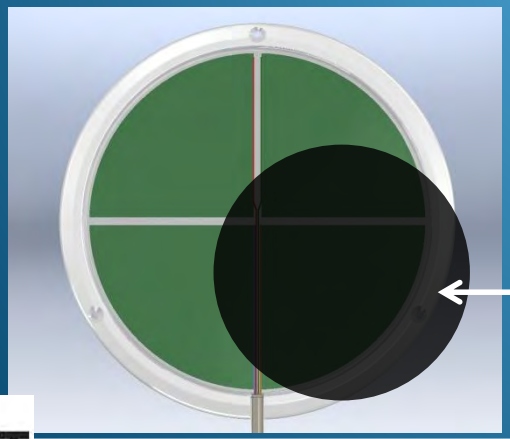
- water equivalent, no perturbation of beam;
- no energy dependence, linear to dose;
- high rates capability;
- negligible temperature dependence;
- high radiation tolerance;
- low cost.

SIT

Proposed solution

- Insert a scintillator detector between the metallic disc and its PTFE cover that compose the protection disk.
- Detector formed by 4 leaves, with independent WLS fibers.
- If the beam is centered on the disc, each leaf produces the same light output.





A new dosimeter is proposed that provides in real time (IT Patent TO2014A000943):

- the correct centering of the protective metallic disc.
- the on-line measurement of the integral dose.

SIT

First prototype & preliminary tests

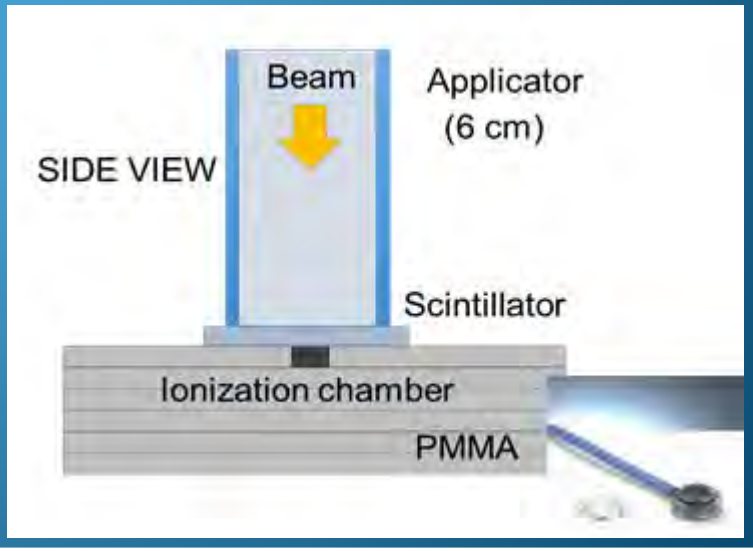
UNDER BEAM:
plastic scintillator tile & optical fiber

REMOTE READOUT:
photodiode & fast ADC

- Light → *Photodiode* → analog signal → *Fast ADC* → digital pulse shape (20 ns sampling time).
- Each pulse shape is visible online and recorded for offline analysis.

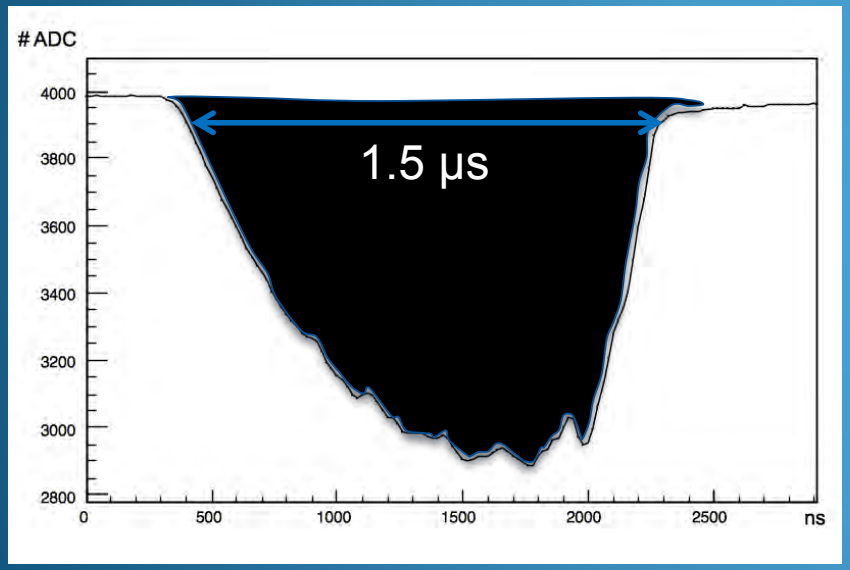
The prototype was irradiated with a LIAC 10 MeV model (SIT) at ASMN-IRCCS in order to:

- measure the linearity of scintillator response under the electron beam;
- compare its dose measurements with a calibrated ionization chamber (Advanced Markus, PTW).



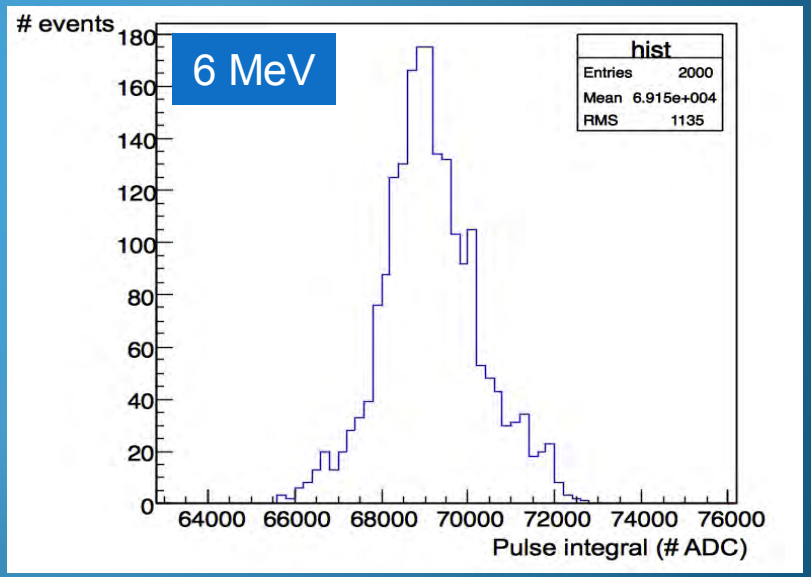
Pulse shape & integrated charge

- The ADC samples (every 20 ns) the pulse shape corresponding to the light output of the scintillator (proportional to dose) for each bunch of Linac electrons



- The area of the pulse shape (integrated charge) correspond to the dose delivered to scintillator by a single burst of the Linac (~ 1 cGy)

- The histogram of the integrated charge of 2000 pulses gives an indication on the uniformity of dose delivered by each pulse
- Less single pulse dose uniformity at higher beam energies



- The integral of the histogram is proportional to the total dose

SIT

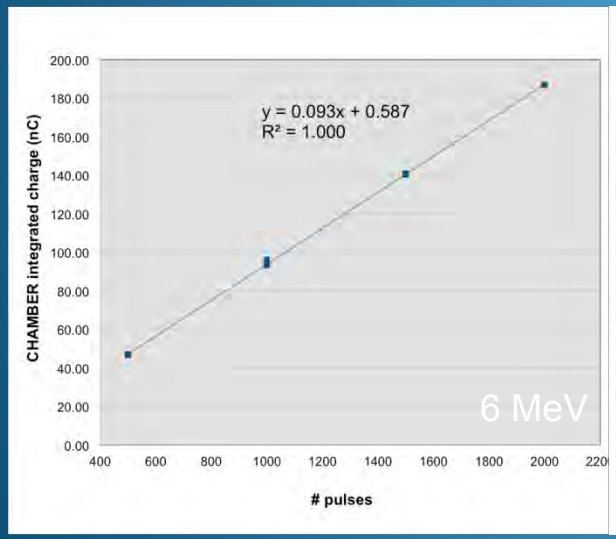
Results: linearity & correlation

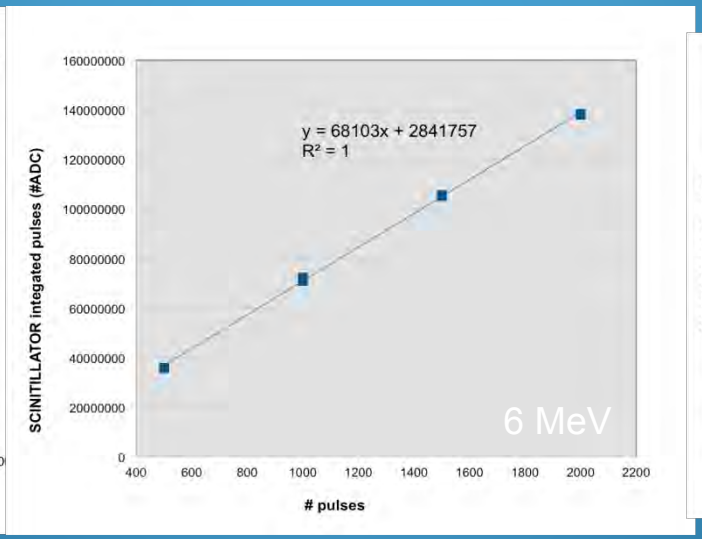
Measure the dose delivered in various runs with different numbers of pulses:

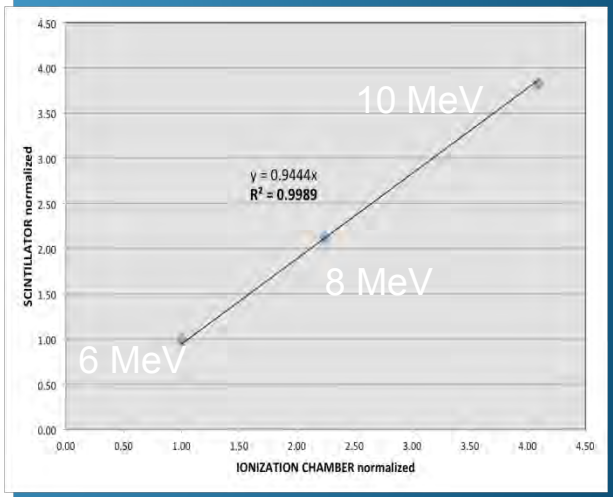
IONIZATION CHAMBER (total charge read out by electrometer)

SCINTILLATOR (sum of the integrated charges of all pulses)

Dose measured by the scintillator & chamber at different energies and d/p (2000 pulses):





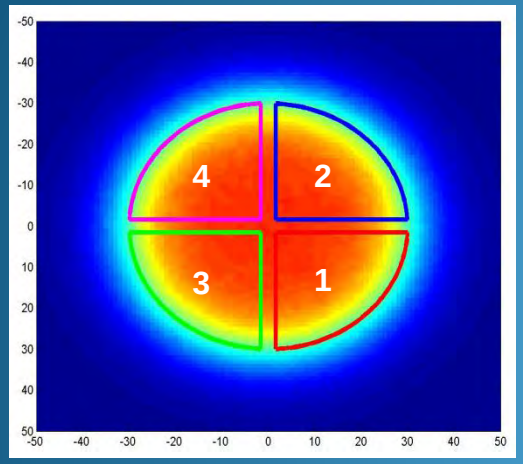


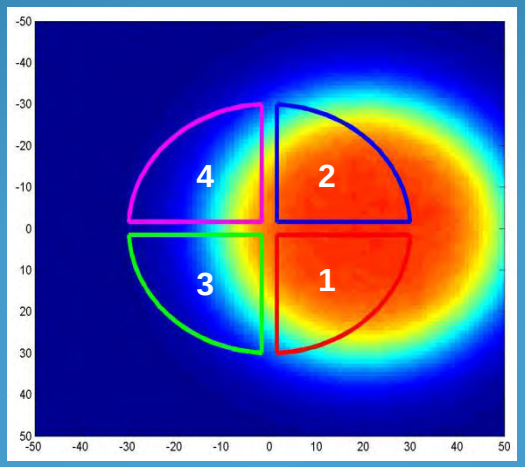
The response of scintillator is linear, as in the case of ionization chamber, and both detectors show a very good correlation.

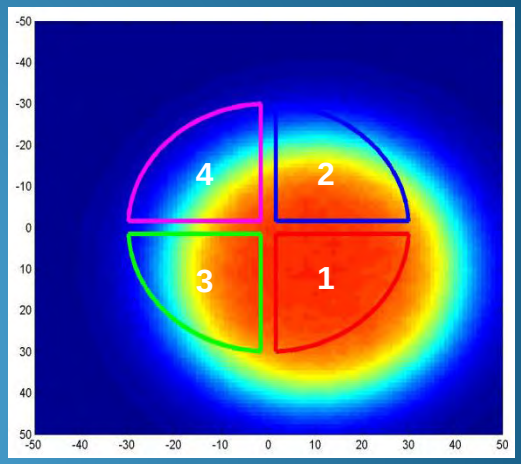
SIT

Monte Carlo simulations

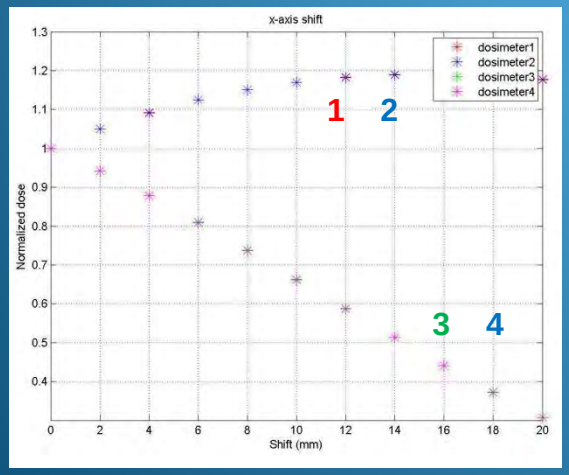
Translation effects of the IORT applicator on the four-leaf detector: MC code EGSnrc / BEAMnrc [Iaccarino G, PMB 2011], beam energy of 10MeV, cone of 60 mm, detector diameter of 70 mm (1 mm thick), depth in tissue of 27mm, light blue isodose of 90%.



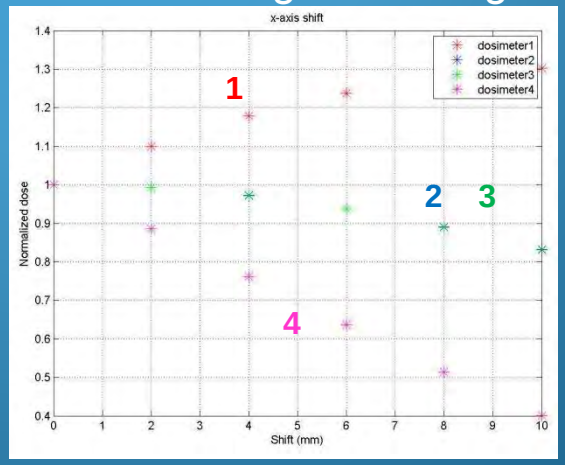




Lateral translation



Translation along a leaf-diagonal



Each leaf has its own pattern of response

Conclusions

The proposed plastic scintillator for in vivo dosimeter improves the IORT clinical practice since it makes:

- a check of the right position of the protection disc with very small dose (~ 1 cGy); the surgeon could correct the positioning of the disc before delivering the treatment.
- a real time check of the protection disk position;
- a real time check of the dose delivery over the whole treatment.

First one-leaf prototype tested with positive results (sensitivity, linearity, absolute dose measurement,..).

Next steps:

- engineering and validation;
- Certification – fourth quarter 2016/first quarter 2017

Radiotherapy in the management of epidemic Kaposi's sarcoma

Doses range from 10 to 30 Gy, according to tumor response and toxicity

Total dose: 45-70 kV X-rays, depending on tumor size and location

Doses of 15 Gy for oral lesions, 20 Gy for lesions involving eyelids, conjunctiva, and genitals, have been shown to be sufficient to produce shrinkage of the tumor and good palliation of the symptoms

For the cutaneous EKS, we propose 30 Gy given in a local field, using a fractionated scheme with small size applicators.

Kirova YM, Belembaogo E, Frikha H, Haddad E, Calitchi E, Levy E, Piedbois P, Le Bourgeois JP. Radiotherapy in the management of epidemic Kaposi's sarcoma: a retrospective study of 643 cases. Radiother Oncol. 1998 Jan;46(1):19-22.

RADIANCE

Treatment Simulation Software

RADIANCE: Treatment simulation software

• **What is *RADIANCE* ?**

Software developed by a spanish company, partner of Zeiss: GMV

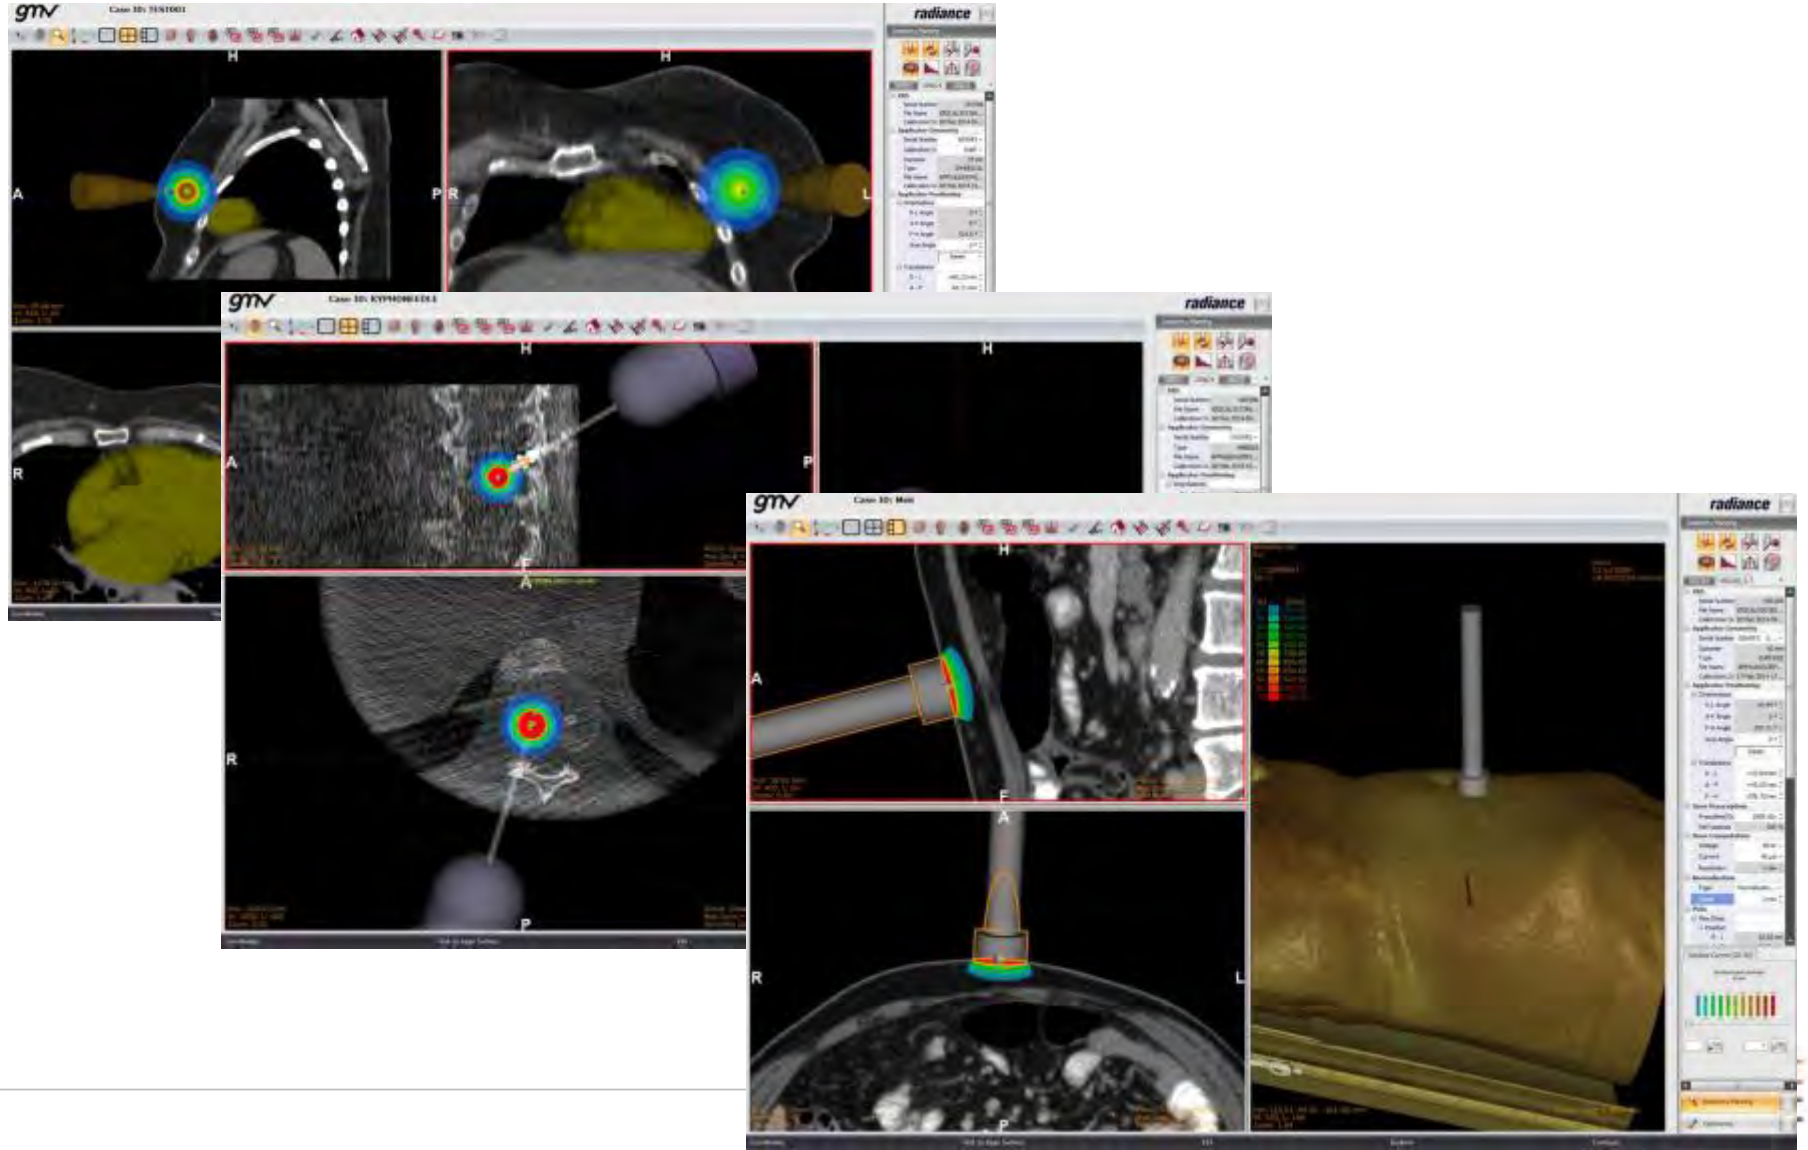
• ***RADIANCE:* What is it used for?**

To plan and simulate the treatment with Intrabeam before delivering to the patients.

• ***RADIANCE: what does it do?***

From a preoperative image of the patient (CT scan) it simulates the Intrabeam applicators so calculating the dose distribution.

RADIANCE: Treatment simulation software



radiance: applicators

- Spherical Applicators

- Needle Applicators

- Flat Applicators

- Surface Applicators

radiance: when is it used? Planning phases

PRE-PLANNING 1
Different alternative approaches
No time constrains

INTRA-PLANNING 2
Re-plan in the OR as necessary
Display the dose distribution after updating the planning

POST-PLANNING 3
Review for quality control and follow-up of the patient

Trade/Device Name: [illegible]
Regulation Number: 21 CFR 892.5050
Regulation Name: Medical charged-particle radiation therapy system
Regulatory Class: II
Product Code: MUJ
Dated: December 8, 2011
Received: December [illegible], 2011

Dear [illegible]

We [illegible] section 510(k) premarket notification of intent to market the device referenced above and have determined the device is substantially equivalent (for the indications for use stated in the enclosure) to legally marketed predicate devices marketed in interstate commerce prior to May 28, 1976, the enactment date of the Medical Device Amendments, or to devices that have been reclassified in accordance with the provisions of the Federal Food, Drug, and Cosmetic Act (Act) that do not require approval of a premarket approval application (PMA). You may, therefore, market the device, subject to the general controls provisions of the Act. The general controls provisions of the Act include requirements for annual registration, listing of devices, good manufacturing practice, labeling, and prohibitions against misbranding and adulteration.

If your device is classified (see above) into class II (Special Controls), it may be subject to such additional controls. Existing major regulations affecting your device can be found in Title 21, Code of Federal Regulations (CFR), Parts 800 to 895. In addition, FDA may publish further announcements concerning your device in the Federal Register.

Please be advised that FDA's issuance of a substantial equivalence determination does not mean that FDA has made a determination that your device complies with other requirements of the Act or any Federal statutes and regulations administered by other Federal agencies. You must comply with all the Act's requirements, including, but not limited to: registration and listing (21 CFR Part 807); labeling (21 CFR Parts 801 and 809); medical device reporting (reporting of

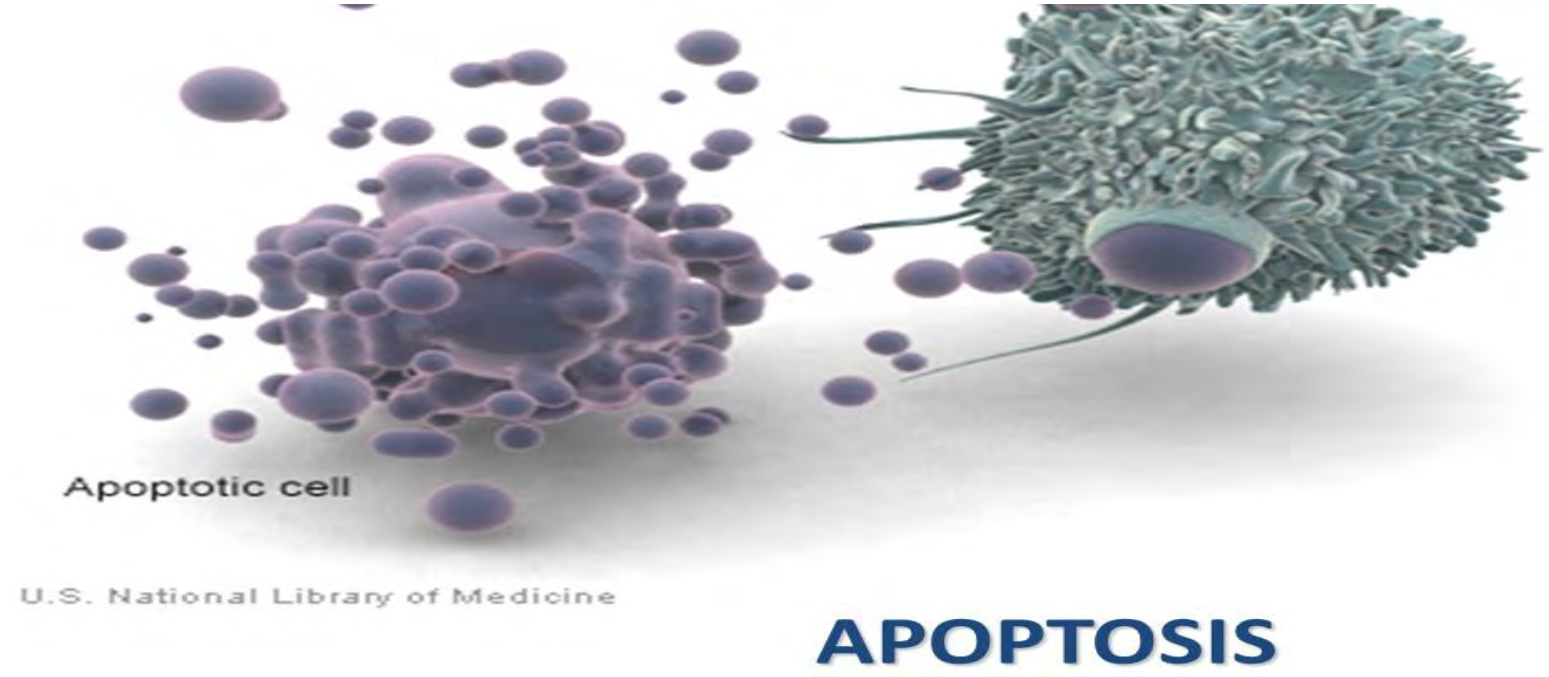
More Effectiveness?

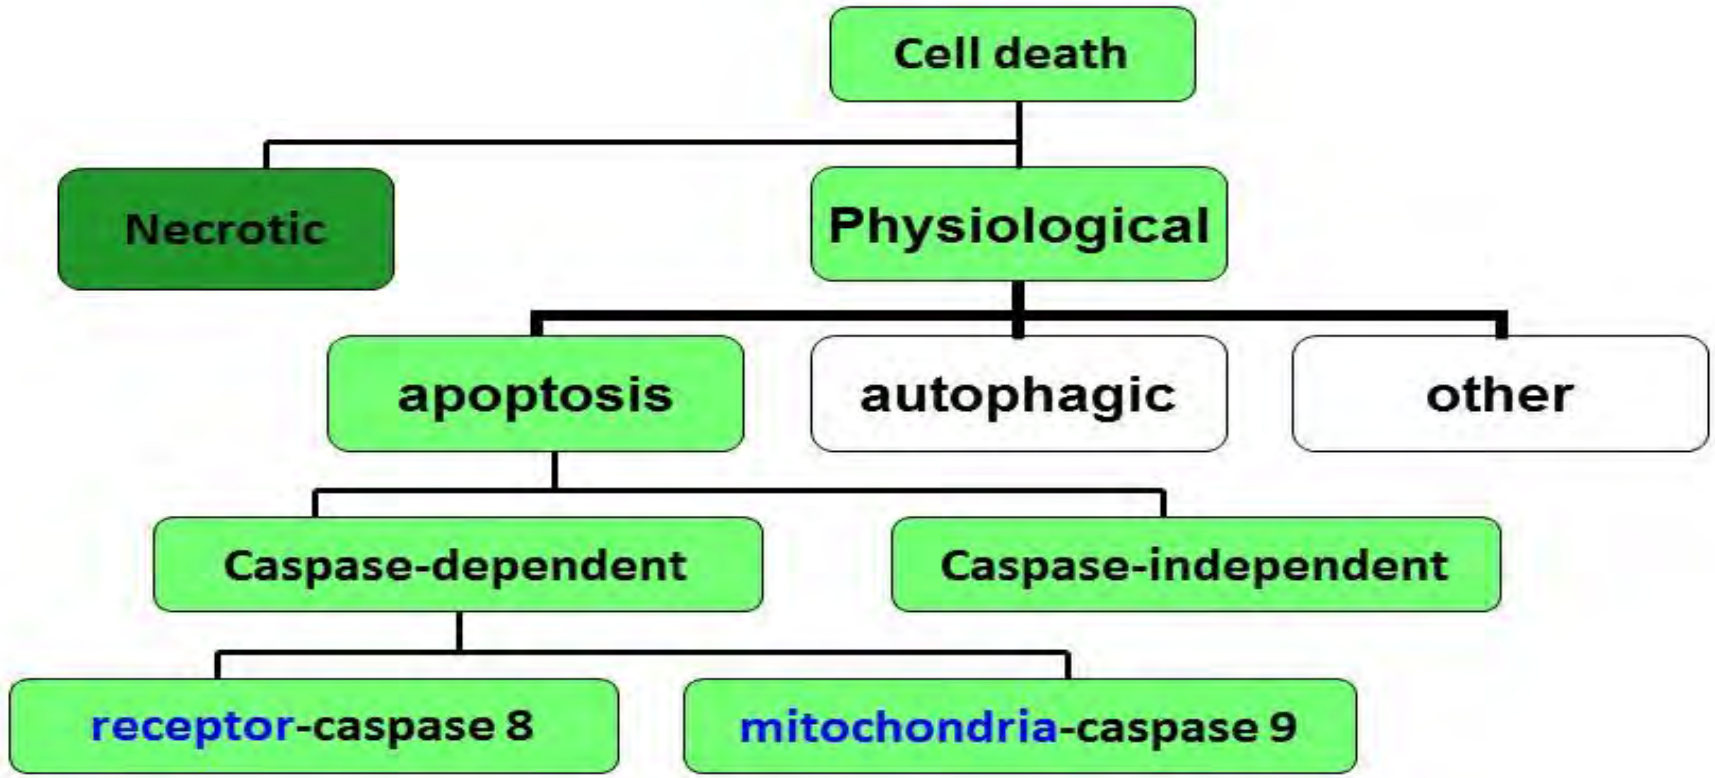
CONTEXT OF HYPOTHESIS OF IORT EFFECT

- Since more than 1000 years now it has been hypothesized that tumors act as wounds that don't heal (Avecina, 1000 & nowadays Dvorak NEJM, 1986)
- Lesson learned that tumor development and progression is the result of a complex interaction between cancer cells (cancer stem cell) and local microenvironment
- A normal microenvironment preserve the tissue architecture even in the presence of predisposed cells thereby preventing tumor progression
- Vice versa an aberrant microenvironment can promote the mutated cells to form tumors
- Epigenetic role in producing and transferring microenvironment?

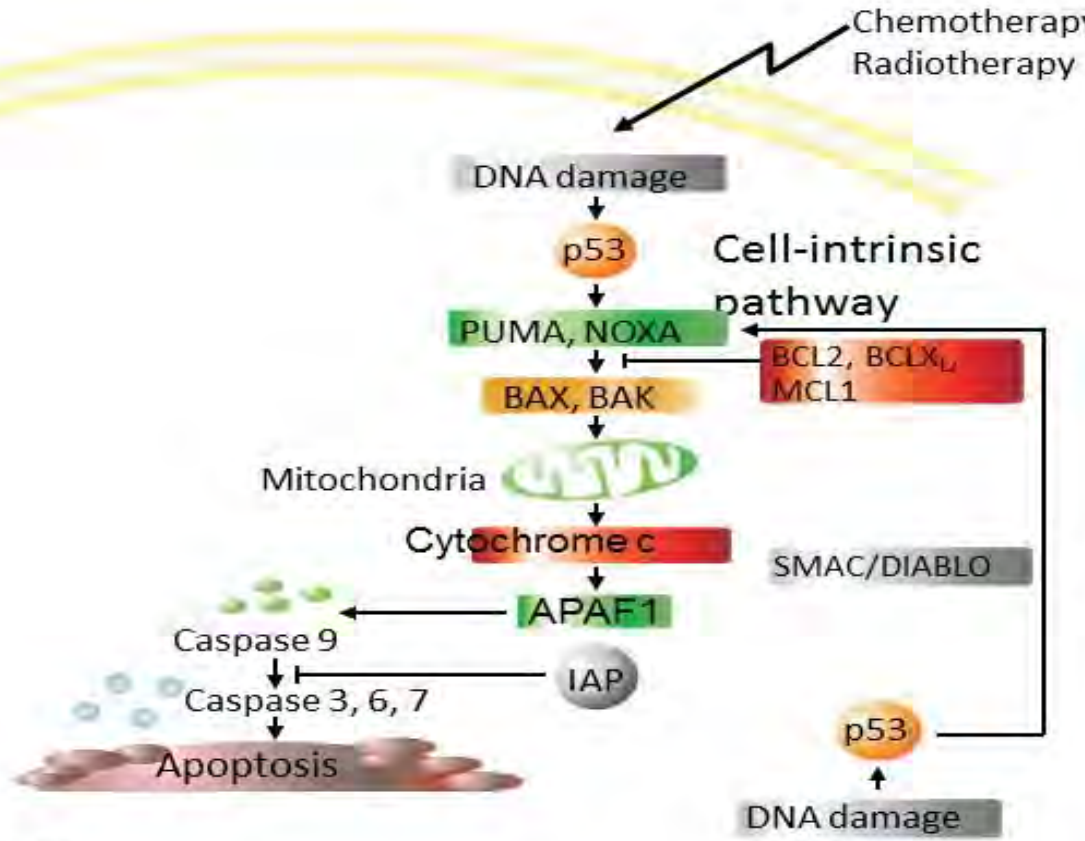
RADIOBIOLOGICAL EFFECT OF IORT



Classification of cell death



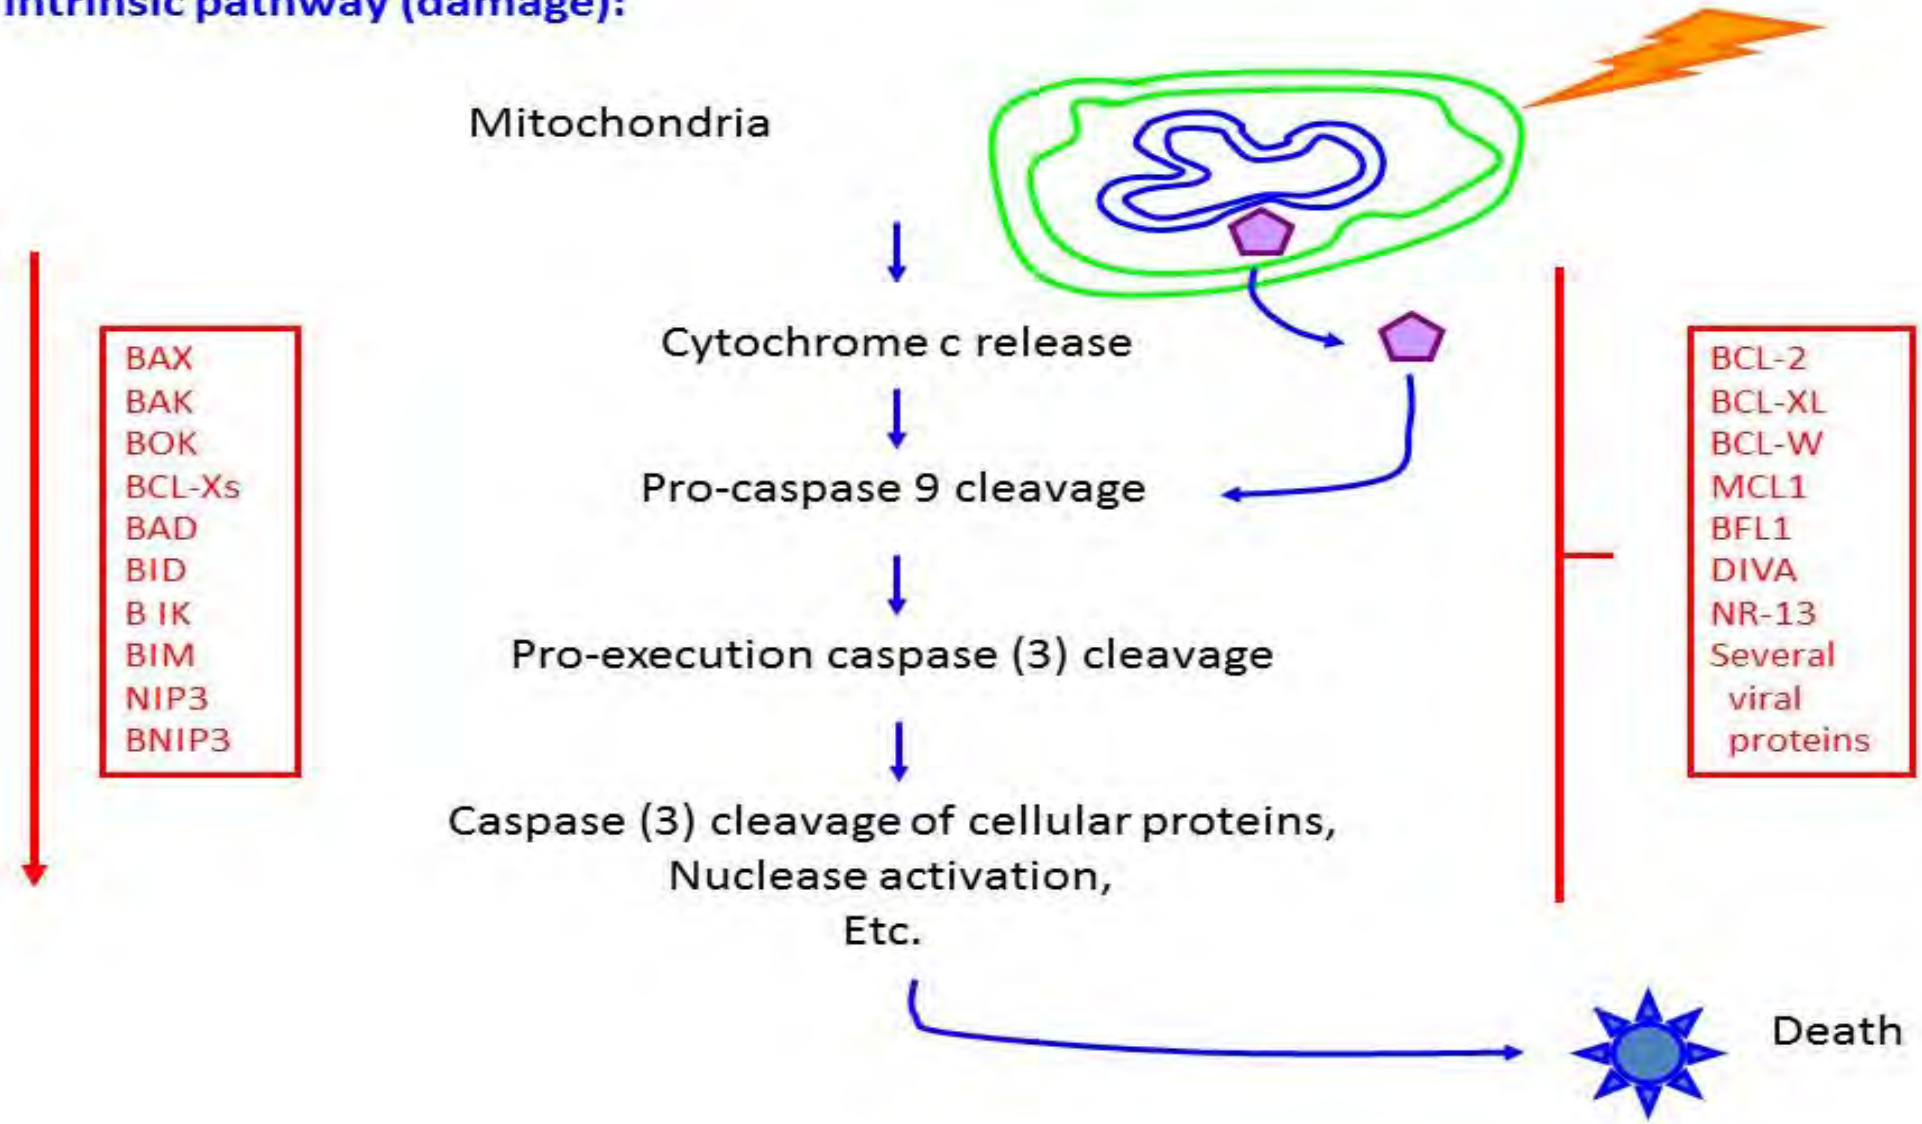
The Intrinsic Apoptosis Pathway



Adapted from Ashkenazi A. Nat Rev Cancer 2002;2:420–430.
APAF1, apoptotic protease activating factor-1; BAK, BCL2 homologous antagonist/killer; BAX, BCL2-associated protein; BCL2, B-cell chronic lymphocytic leukemia/lymphoma 2; BCLX$_L$, BCL2-like 1; IAP, inhibitor of apoptosis protein; MCL1, myeloid cell leukemia sequence 1 (BCL2-related); PUMA, p53-upregulated modulator of apoptosis; SMAC/DIABLO: second mitochondria-derived activator of caspase/direct IAP binding protein with low pI.

APOPTOSIS: control

Intrinsic pathway (damage):



The Intrinsic Apoptosis Pathway

- The intrinsic pathway is triggered by the p53 tumor-suppressor in response to DNA damage and other types of severe cell stress
- Conventional anticancer therapies, such as chemotherapy and radiotherapy, activate this pathway via p53
- p53 activates the intrinsic pathway through transcriptional upregulation of pro-apoptotic members of the BCL2 family of proteins such as PUMA and BAX
- BAX causes the release of cytochrome *c* from the mitochondria, which together with the adaptor APAF1, activate the initiator caspase 9
- Caspase 9 activates the effector caspases 3, 6, and 7, which are responsible for destroying critical components of the cell, and inducing apoptosis
- p53 is inactivated by mutations in more than half of human cancers

Methods of Apoptosis Analysis

- Molecular expression and caspase mediated cleavage
- Membrane associated changes (Annexin V and Ceramide-sphingomyelin pathways)
- Nuclear morphology (condensation, apoptotic bodies, endonuclease activity)
- Analysis: IHC, flow cytometry, DNA electrophoresis, cell staining, TUNEL assay

- **Proteomics**

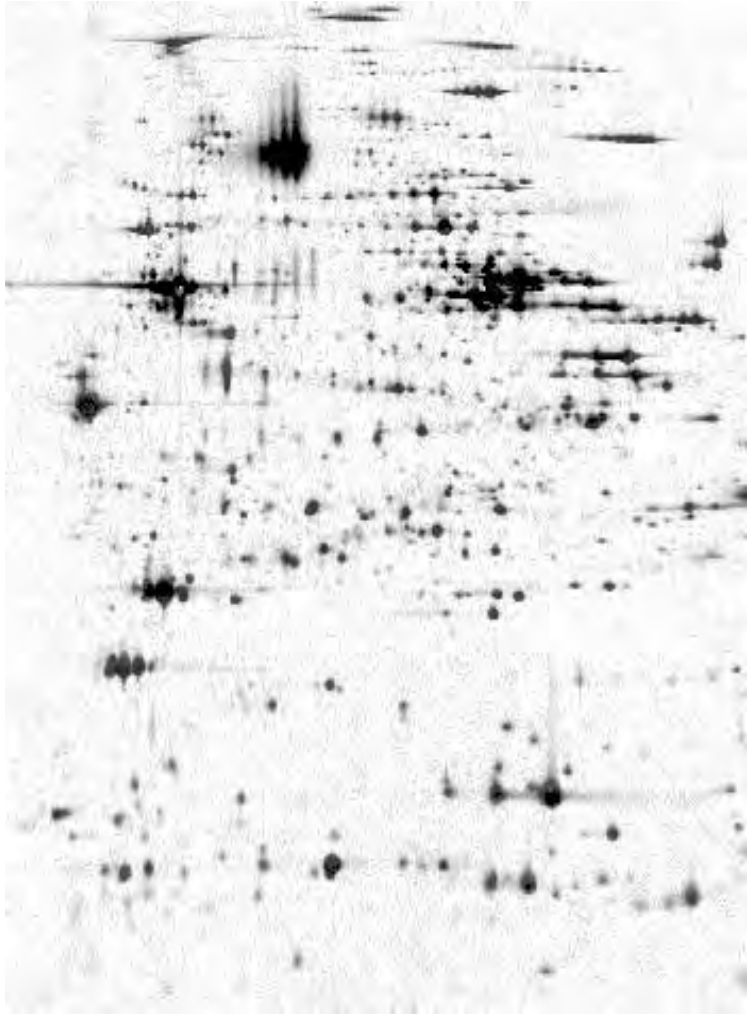
SO HOW DOES IT WORK?

Proteins are resolved, sometimes on a massive scale. Protein separation can be performed using 2-D gel electrophoresis,

- `usually separates proteins first by ***isoelectric point*** and then by ***molecular weight***.

Once proteins are separated and quantified, they are identified

Individual spots are cut out of the gel and cleaved into peptides with proteolytic enzymes



OUR RESEARCH DESIGNEE

- Wound Fluid Proteomics Investigation
- Tissue Proteomics Investigation

❑ Sampling (Tissue Proteomics Investigation):

- collected following breast-conserving surgery in 1 patients whom had received radical IORT with LINAC (21 Gray dose):

✓ Normal tissue Before IORT

✓ Normal tissue After IORT

✓ Margin tissue Before IORT

✓ Margin tissue After IORT

✓ Tumor tissue

WOUND FLUID

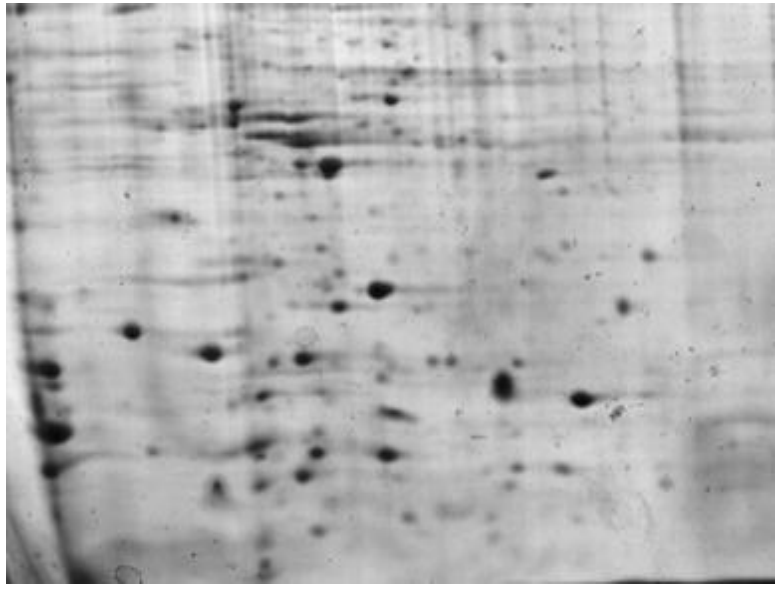
24 hours after surgery from:

Irradiated and non Irradiated cases

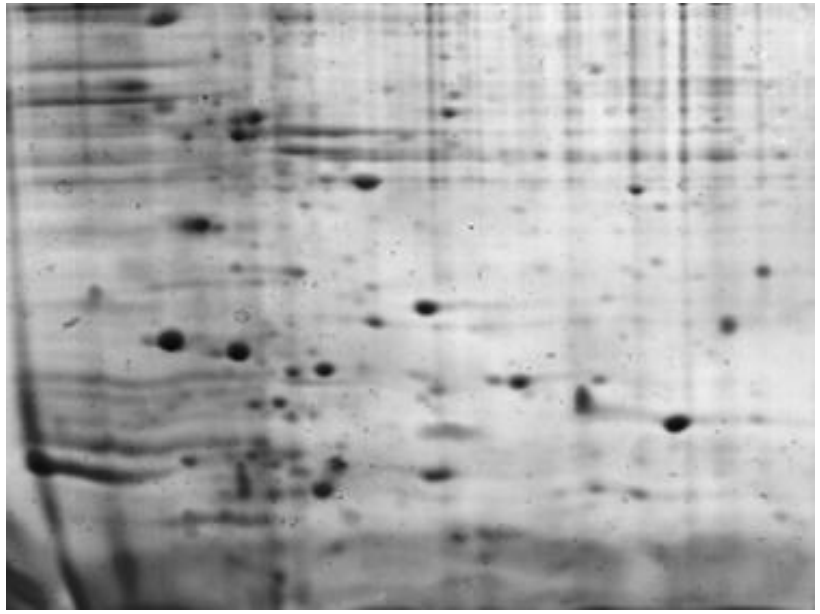
RESULT

- 562 Proteins spot was detected in all gels electrophorese
- 560 proteins spot was the same in two gel electrophorese (normal tissue before and normal tissue after IORT)
- 558 proteins spot was the same in two gel electrophorese (margin tissue before IORT and Tumor)
- 543 proteins spot was the same in two gel electrophorese (margin tissue before and after IORT)
- ✓12 proteins spot were increased after IORT in Margin tumor bed compared to the same tissue before IORT
- ✓7 proteins spot were decreased after IORT in Margin tumor bed compared to the same tissue before IORT

MARGIN TISSUE BEFORE IORT AND TUMOR (NO SIGNIFICANCE)

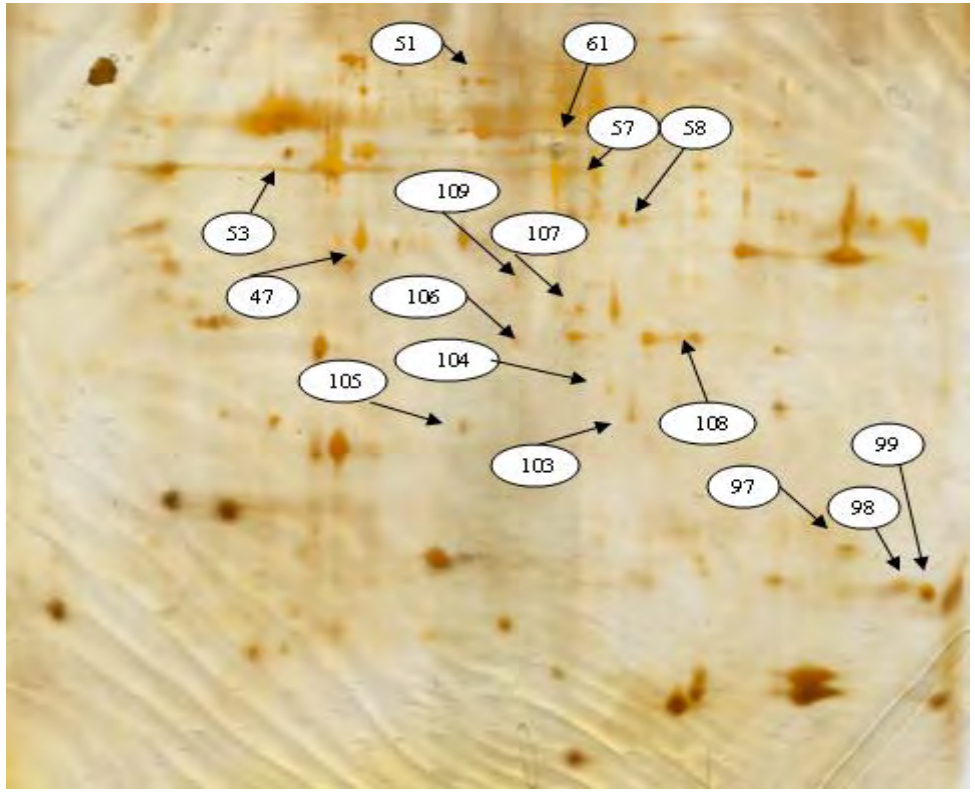


Before IORT



tumor

MARGIN TISSUE BEFORE AND AFTER IORT



After IORT

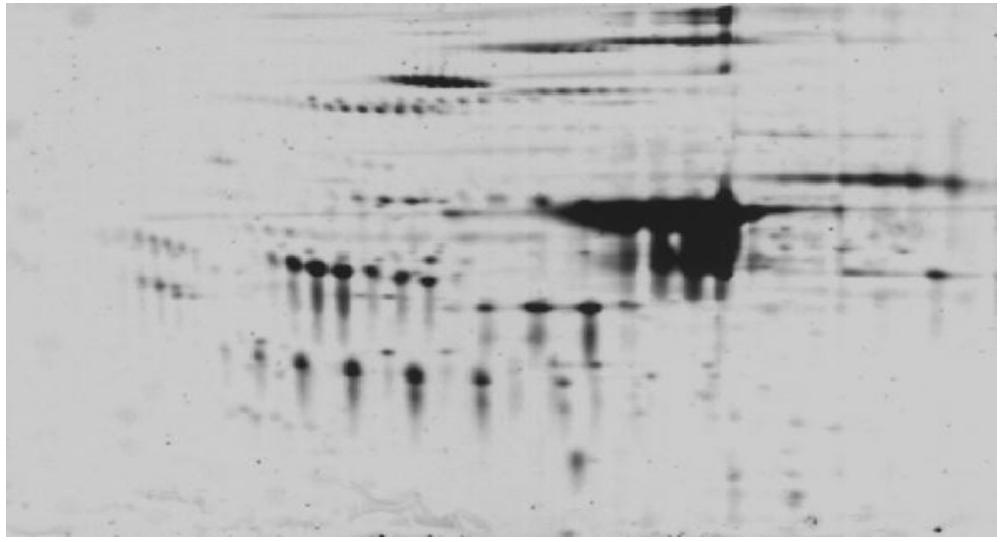
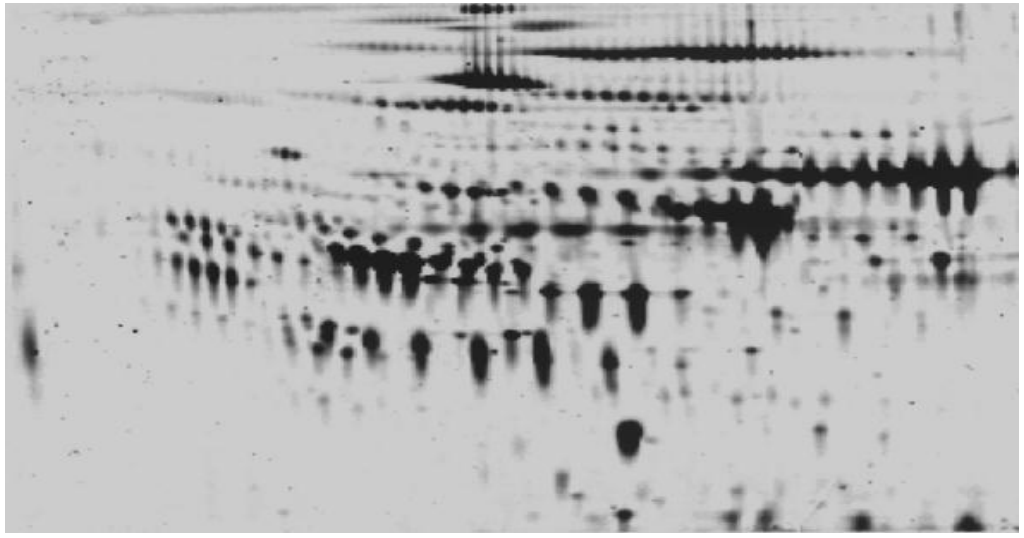
PROTEOMIC PROFILE

WOUND FLUIDS (WF), COLLECTED OVER 24 H FOLLOWING BREAST-CONSERVING SURGERY IN PATIENTS SURGICAL, THE LEFT GEL HAD RECEIVED ADDITIONAL *IORT* , IMMEDIATELY AFTER THE SURGICAL EXCISION AND THE RIGHT GEL IS CONTROL GROPE.

- 178 Proteins spot was detected in two gel electrophorese
- ✓144 proteins spot was the same in two gel electrophorese
- ✓28proteins spot were increased in sample vs. control
- ✓6 proteins spot were decreased in sample vs. control

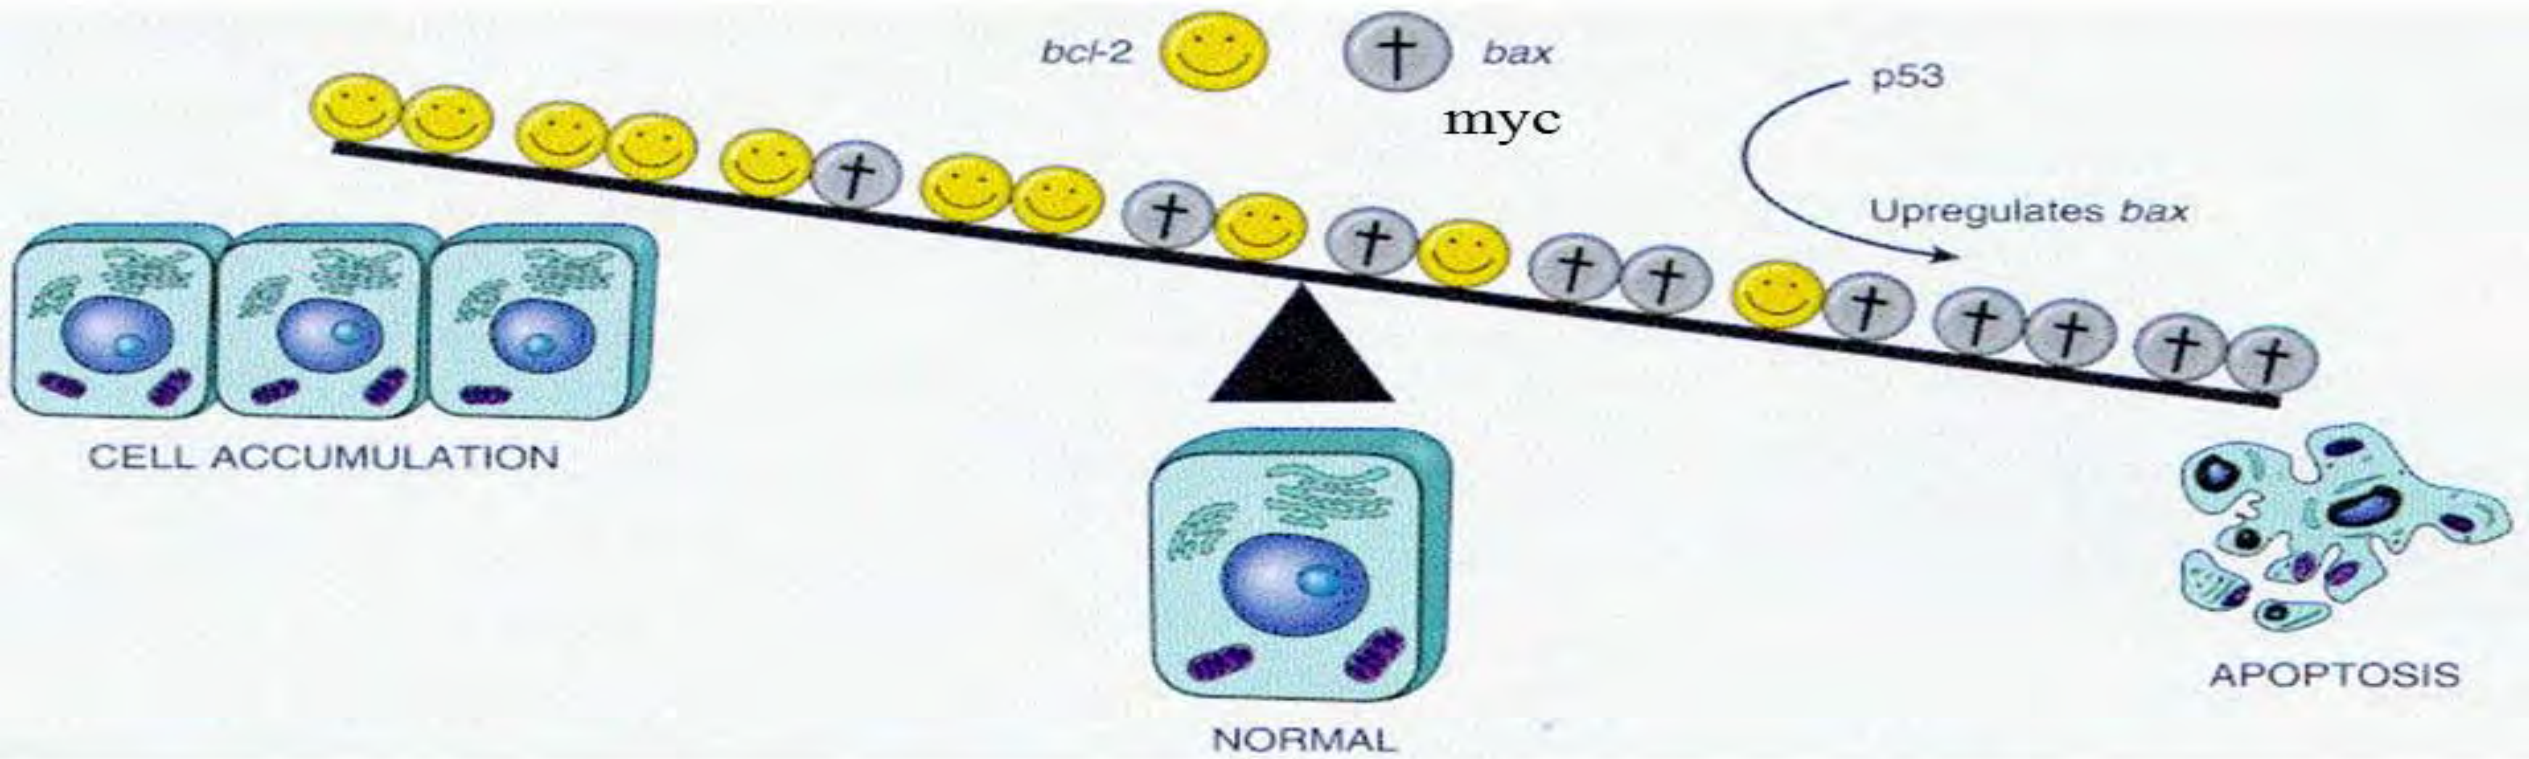


Sample



Control

The Apoptotic Balance in Normal Cell Hierarchies

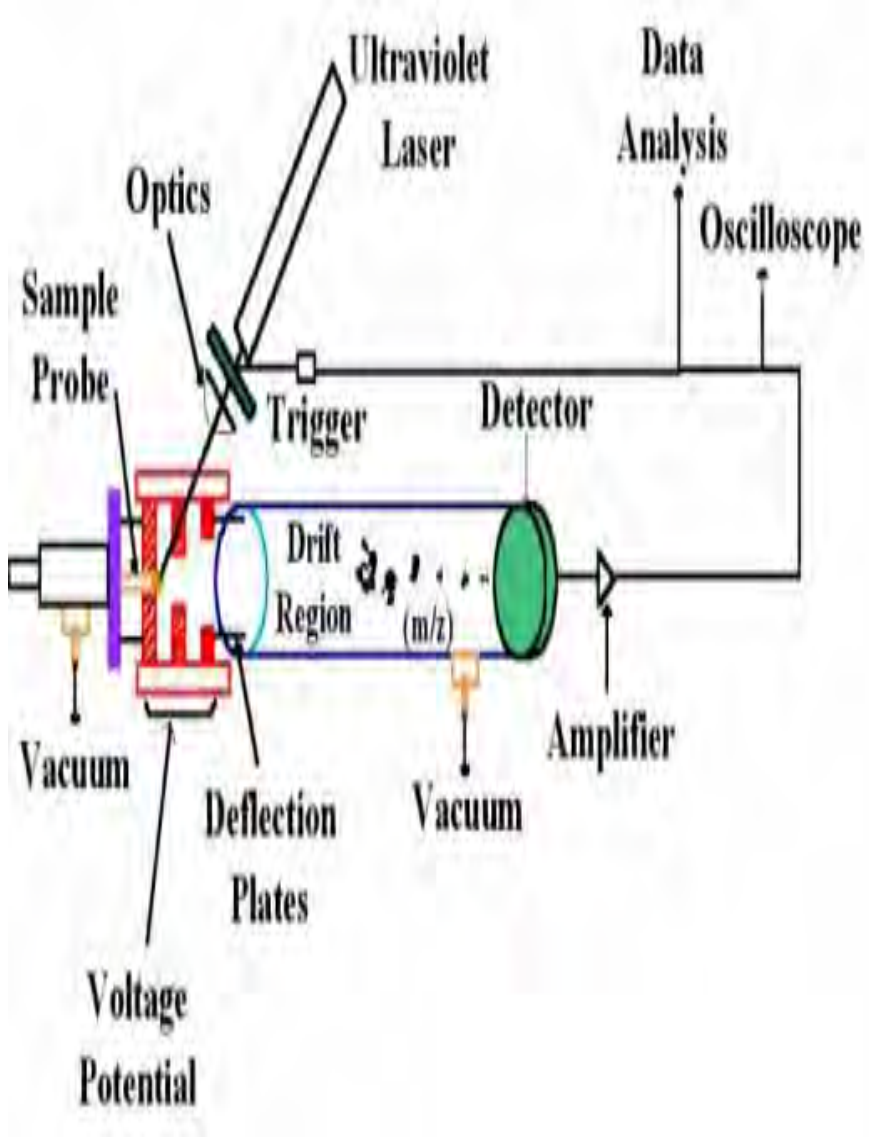


If Abnormal Accumulation of Mutant Cells due to loss Of Apoptotic Control (ie, increased bcl-2 or mutant p53 or loss of myc control) = Tumour Formation

SO HOW DOES IT WORK?

In a MALDI-TOF mass spectrometer, the ions can also be deflected with an electrostatic reflector that also focuses the ion beam.

Thus, the masses of the ions reaching the second detector can be determined with high precision and these masses can reveal the exact chemical compositions of the peptides, ***and therefore their identities!***



TARGETED INTRAOPERATIVE RADIOTHERAPY (TARGIT), TRAIL

Targeted Intraoperative Radiotherapy Impairs the Stimulation of Breast Cancer Cell Proliferation and Invasion Caused by Surgical Wounding

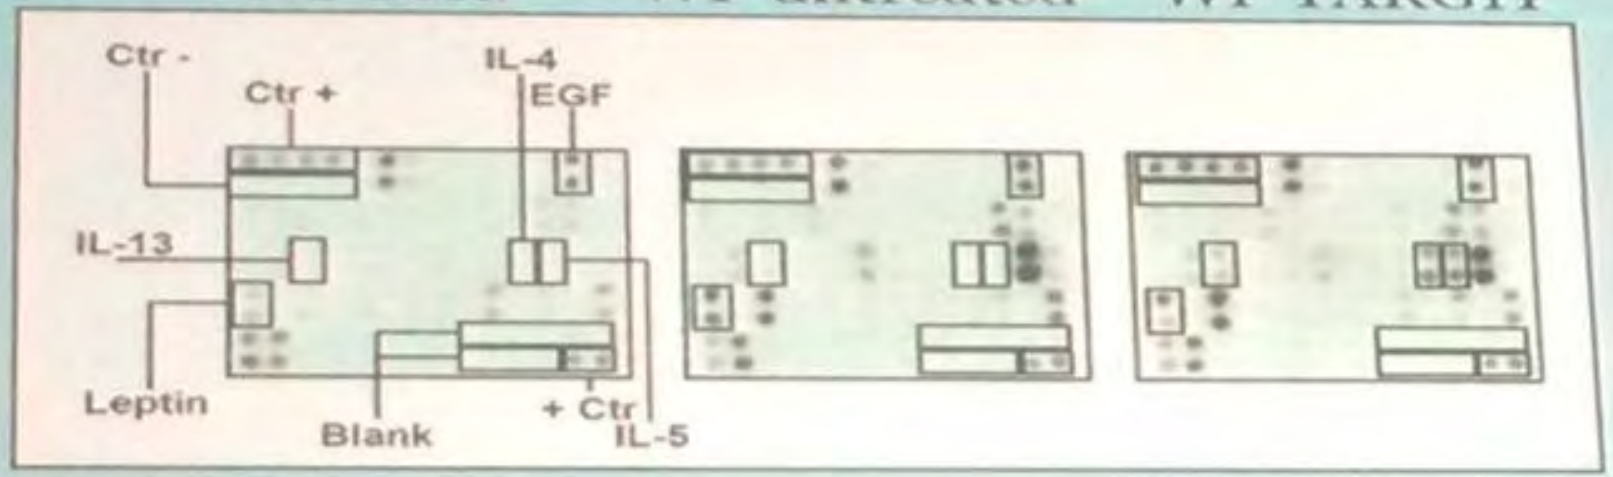
Experimental Design:

- studied normal and mammary carcinoma cell growth and motility are affected by surgical wound fluids (WF), collected over 24 h following breast-conserving surgery in patients whom had received additional *TAR*Geted *I*ntraoperative radio*T*herapy (TARGIT) immediately after the surgical excision.
- The ***proteomic profile*** of the WF and their effects on the activation of intracellular signal transduction pathways of breast cancer cells were also analyzed.

Results:

- WF stimulated proliferation, migration, and invasion of breast cancer cell lines.
- **The stimulatory effect was almost completely abrogated when fluids from TARGIT-treated patients were used. These fluids displayed altered expression of several cytokines and failed to properly stimulate the activation of some intracellular signal transduction pathways, when compared with fluids harvested from untreated patients.**

IORT WITH INTRABEAM ALTERS THE PROTEOMIC PROFILE OF WOUND FLUID



✓ **Does IORT Radiotherapy affect tumor growth independently from cell killing?**

✓ Which are the molecular mechanisms involved in the response to IORT?

Belletti, et al. Cin. Cancer Res. 2008 14: 1325

Physical Properties

Monte Carlo investigation of breast intraoperative radiation therapy with metal attenuator plates.

Martignano et al., Med.Phys 2007

KRANKENHAUS BARMHERZIGE SCHWESTERN Linz

- 3 mm Pb
  - 40+% backscatter dose
- 6 mm Al + 3 mm Pb
  - around 10% backscatter dose

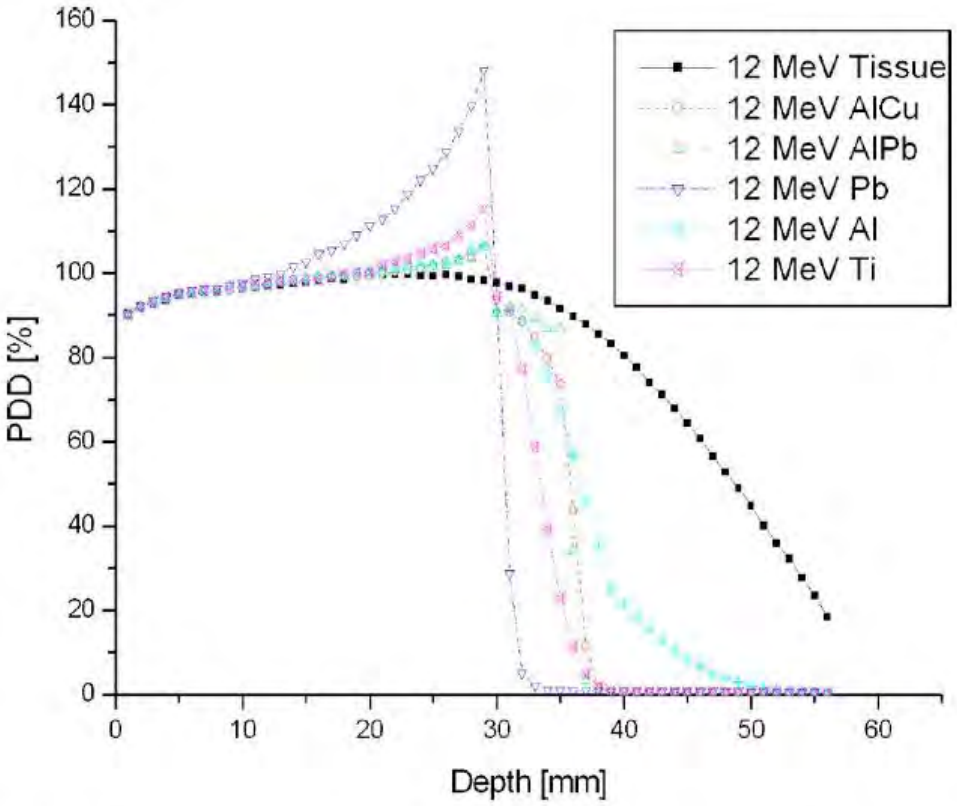

FIG. 5. Percent depth dose on beam axis for five different attenuator plates: (a) 6 mm Al+3 mm Cu; (b) 6 mm Al+3 mm Pb; (c) 3 mm Pb; (d) 9 mm Al; (e) 9 mm Ti. Plates are located after 3 cm of tissue. DOSXYZnrc MC code simulation; 12 MeV nominal energy.

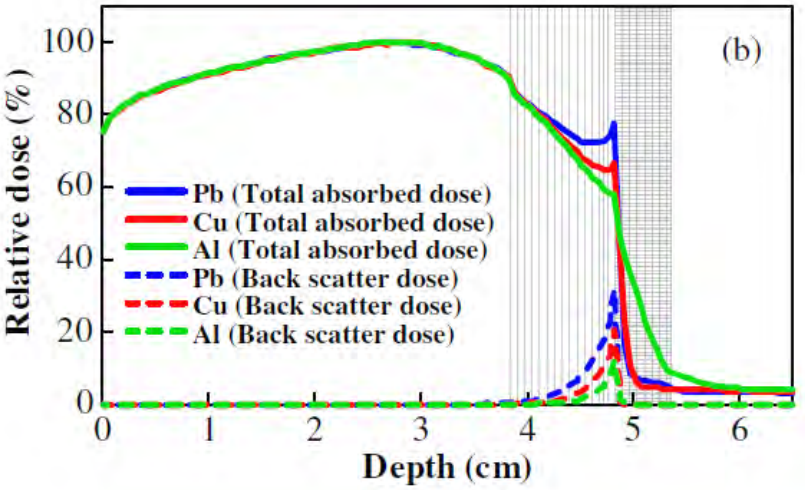
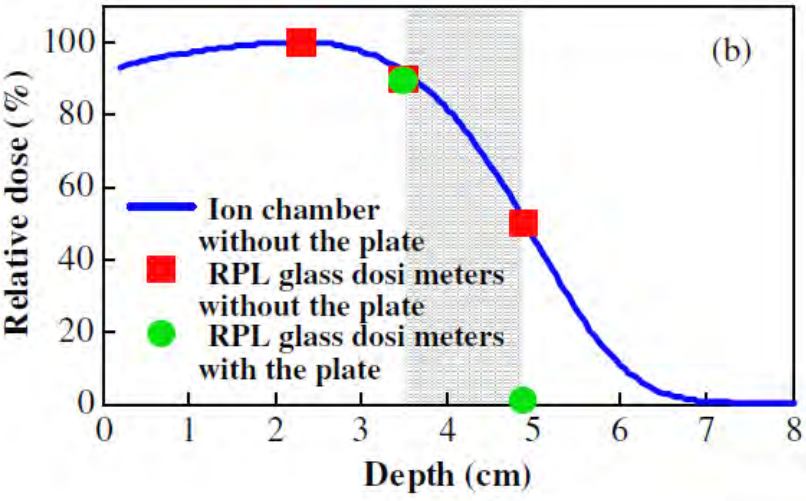
An experimental attenuation plate to improve the dose distribution in intraoperative electron beam radiotherapy for breast cancer.

Oshima et al., Phys. Med. Biol., 2009

KRANKENHAUS BARMHERZIGE SCHWESTERN Linz

- PMMA to reduce backscatter
- Manufactured a prototype
  - 7mm PMMA
  - 3mm Cu
  - 2mm PMMA





12mm thickness; 10,4mm diameter

KRANKENHAUS
BARMHERZIGE
SCHWESTERN
Linz

Implications for the clinical outcome

e.g. ELIOT

KRANKENHAUS
BARMHERZIGE
SCHWESTERN
Linz

- 11% backscatter dose according to ELIOT talk from dott. Stefania Comi 4mm Al + 5 mm Pb.

- Question to the audience:
  - Influence on necrosis rate?
  - „We identified a higher occurence of fat necrosis in the intraoperative radiotherapy group than in the external radiotherapy group.“ ELIOT, Veronesi et al., Lancet 2013

Final remark

KRANKENHAUS
BARMHERZIGE
SCHWESTERN
Linz

- Would it be good to replace the metal only attenuation plates with their PMMA coated metal attenuation plates if no surgical aspects speak against the slightly bigger thickness?
  - Shielding capability is comparable
  - Backscatter is reduced

In vivo dosimetry by EBT3 GAFCHROMIC films during IOERT breast treatment

Manco Luigi

Post-graduate School in Medical Physics, University of Bologna,Italy

Medical Physics Unit, Sant'Anna University Hospital, Ferrara,Italy

Introduction

In vivo dosimetry in IOERT:

- high single dose delivered during treatment
- lack of an individualized treatment plan
- limited choise of detectors

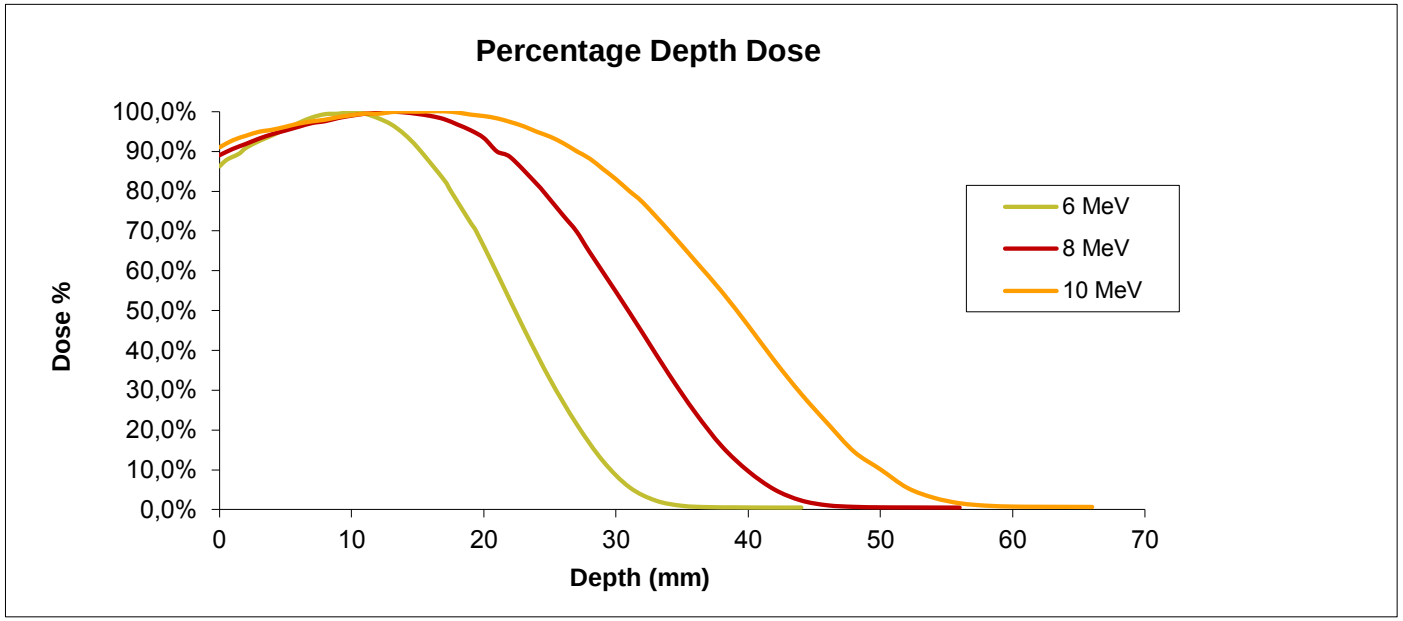
Patients & Materials

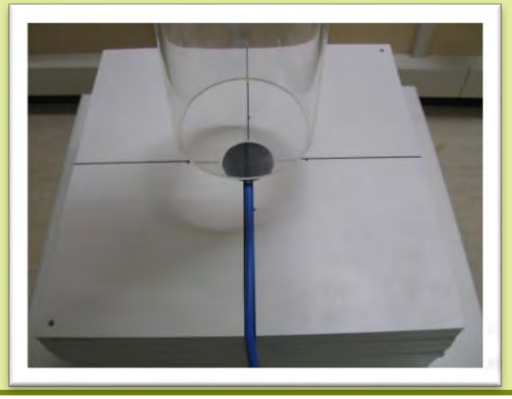
From 09/04/2014 to 06/05/2015	9 Gy	21 Gy
6 MeV	13	12
8 Mev	12	18
10 MeV	2	9
Age (median)	32-50(43)	61-75(70)
Total	66 patients	

Key points

1. LIAC Commissioning & Quality Controls
2. Film Calibration
3. Film positioning during surgery
4. Film reading

1. Liac Commissioning



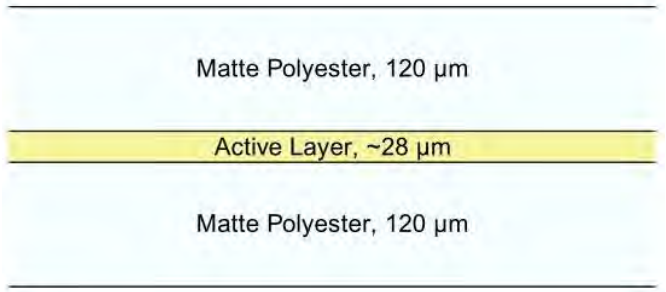


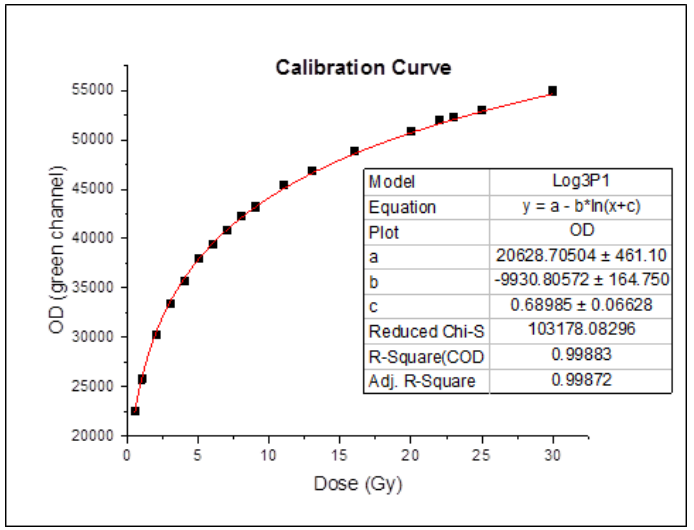
Dose monitoring system:

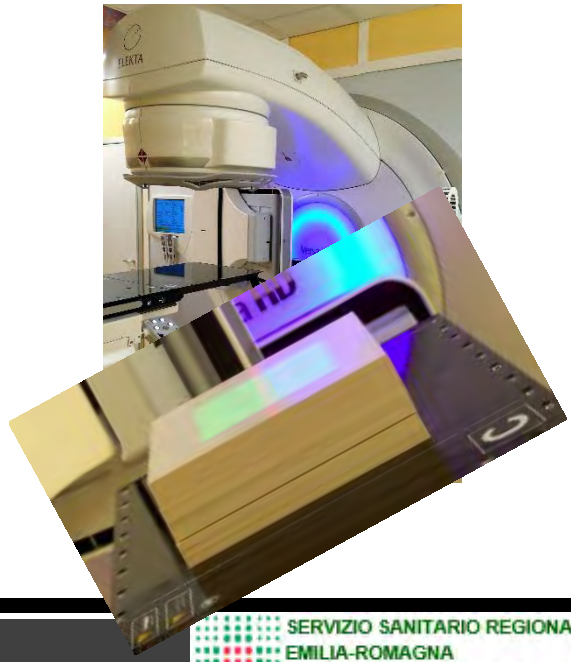
- long time stability ±3%
- short time stability ±1%

2. GAFCHROMIC calibration

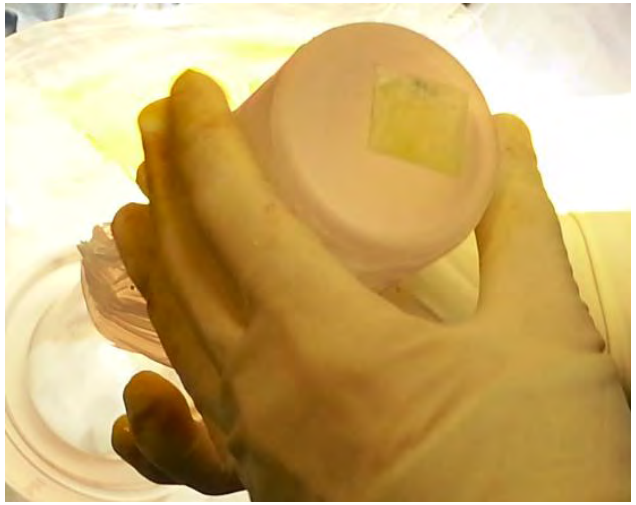
- Solid water-equivalent phantom RW3-PTW
- Large well-charactirezed uniform radiation field
- Measure of absolute dose at the calibration reference depth
- 5 x 5 cm^2 films



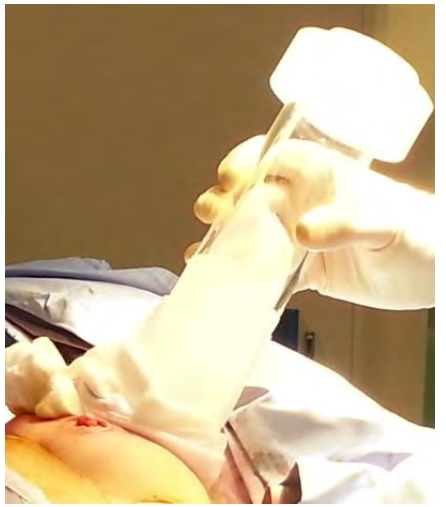


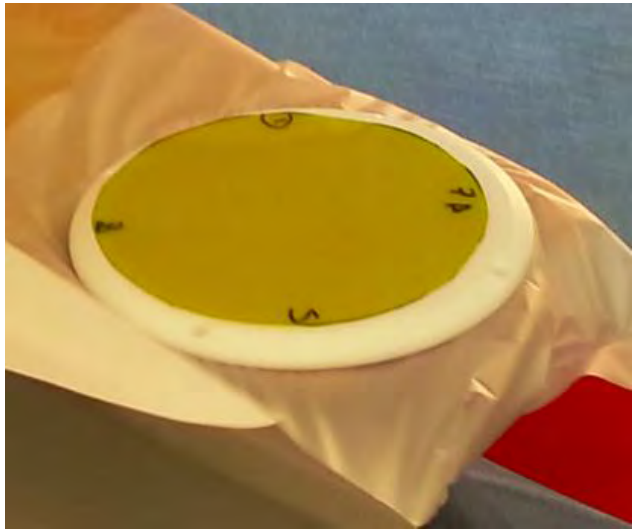


3. Film positioning during surgery



Entrance Dose

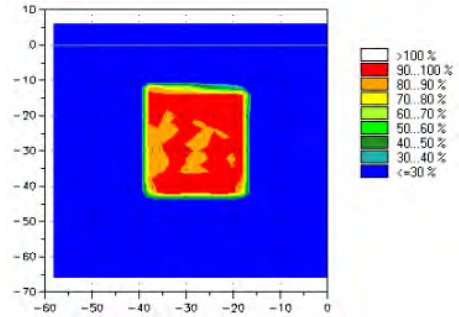


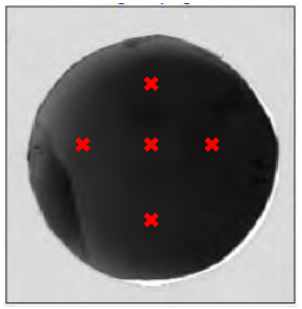


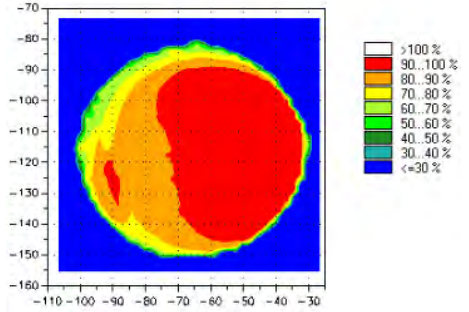
Delivered Dose

4. Film reading

- 48hrs after exposure
- Positional accuracy
- Landscape scanning orientation
- RGB mode – green channel
- Converting optical density into absolute dose
- 5 measure points







Results: 9 Gy

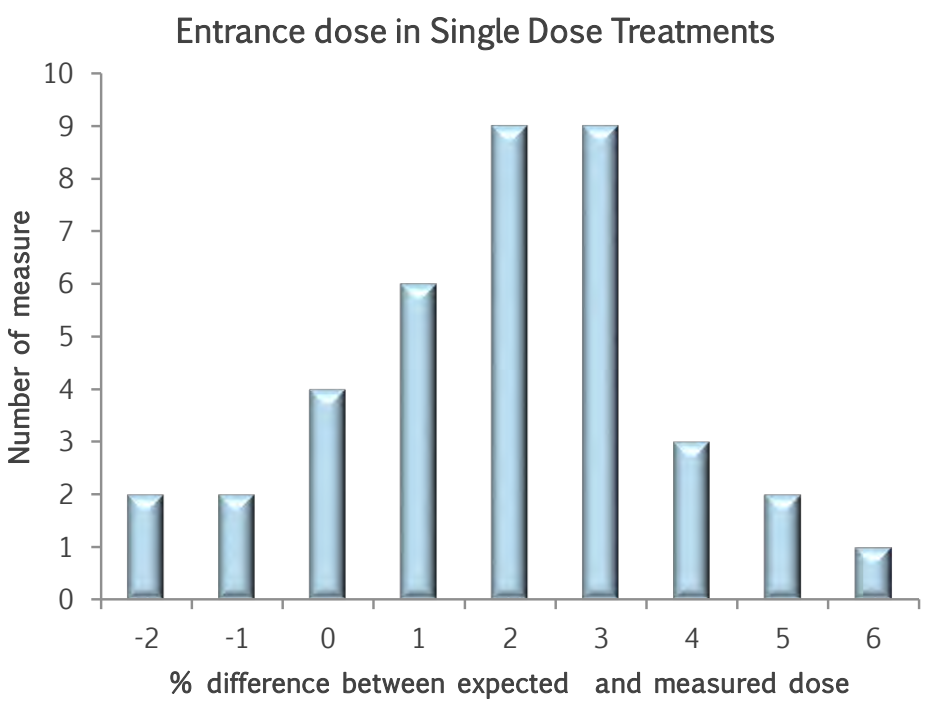
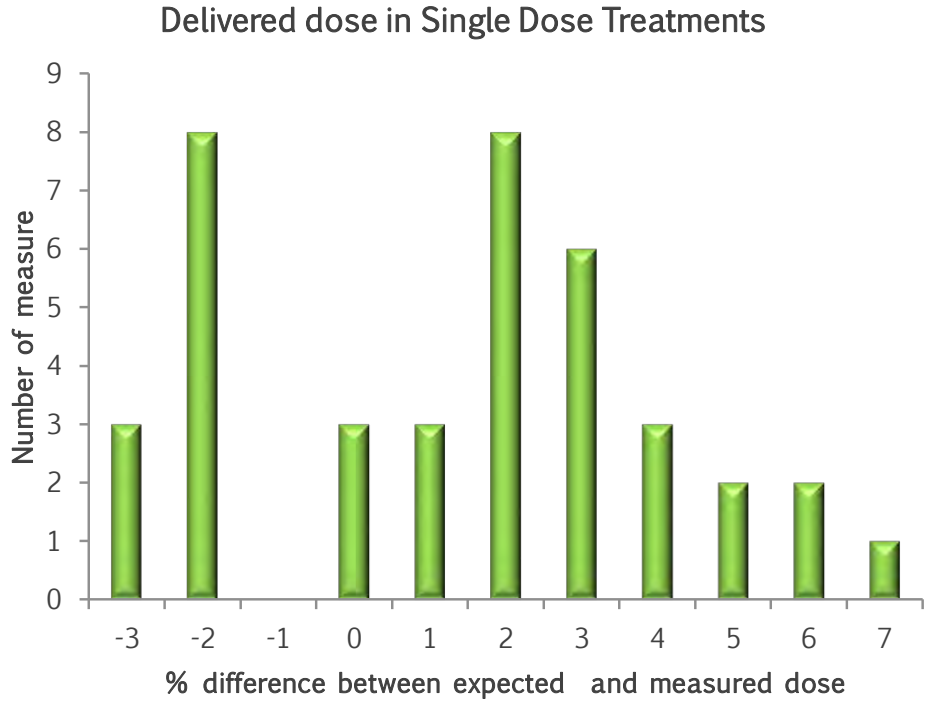
Results: 21 Gy





Conclusions

- GAFCHROMIC EBT3 film positioned on the shielding disc are effective dosimeters for IOERT without any drawbacks in the clinical practice
- Post-processing of irradiated EBT3 films allows to obtain a detailed dose map of the target, the absolute dose delivered and an estimate of the area of the film outside the shielding
- Agreement between measured and expected dose found, is quite good with percentage difference less than 8%

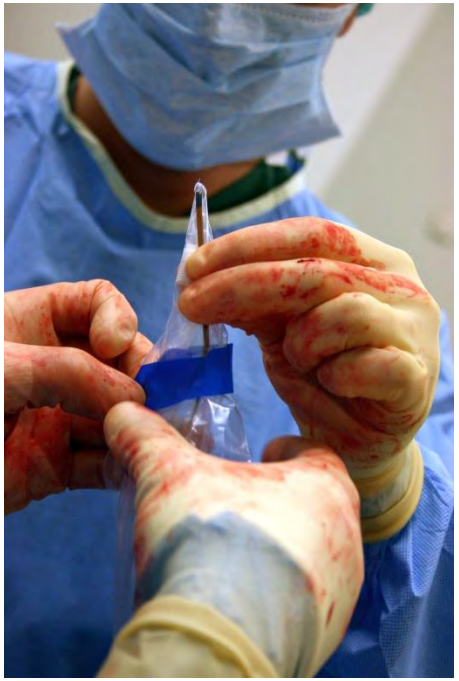
Radiotherapy Centre West, Medical Center Haaglanden - Bronovo, The Hague, The Netherlands

25 June 2016, ISIORT, Novara

IOERT for Rectal Cancer

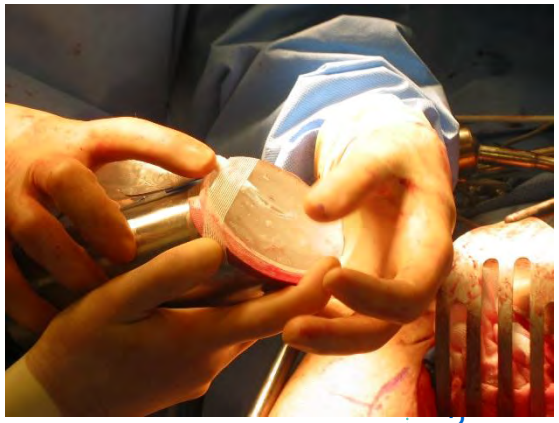
Mobetron 1000



June 2007 till January 2016

39 patients with either locally advanced or recurrent rectal cancer (11.1 Gy prescribed at 100% isodose):

- *In vivo* dosimetry with MOSFETs (metal-oxide semiconductor field-effect transistors) (ESTRO 2008)
- Analysis of the clinical results



IOERT for Partial Breast

Mobetron 1000

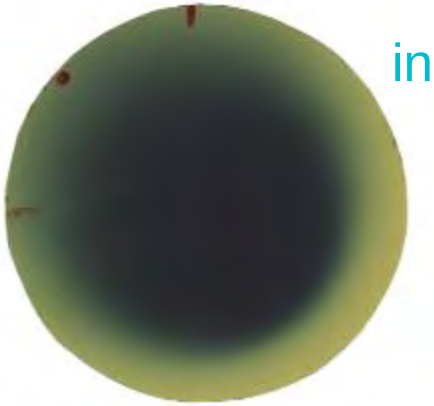
RCWEST
RADIOTHERAPIECENTRUM WEST

May 2010 till January 2016

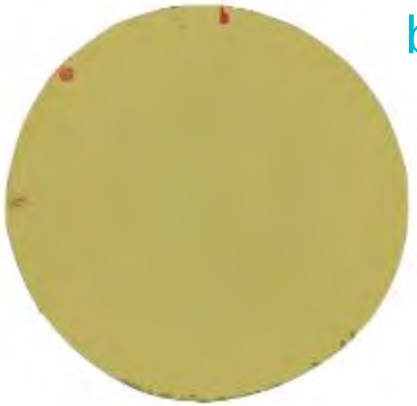
384 elderly ("low risk") breast cancer patients were treated with IOERT (23.3 Gy prescribed at 100% isodose):

- Pilot study May 2010 till January 2011
- Phase II study since January 2011
- *In vivo* dosimetry with MOSFETs or/and Gafchromic films for 47 patients (ESTRO 2015)

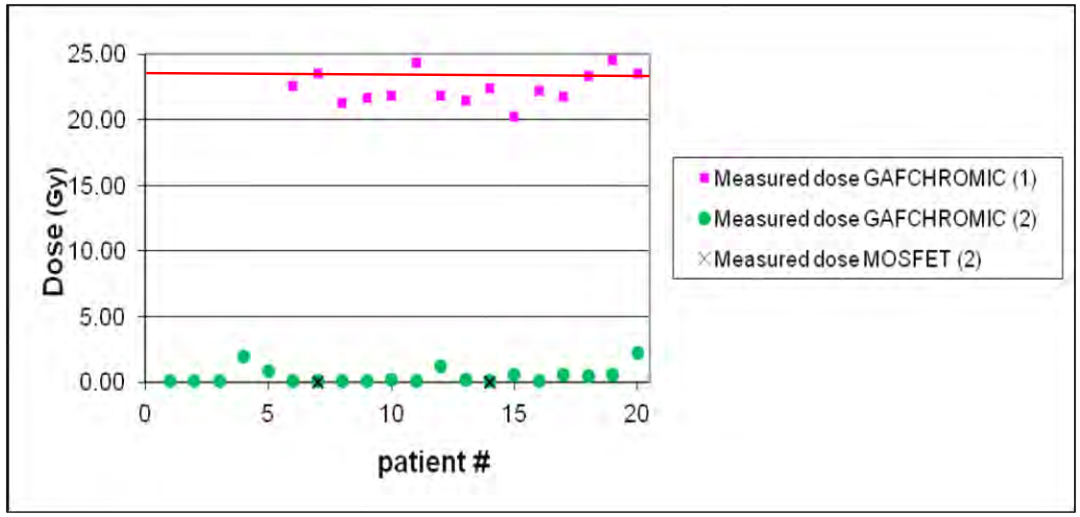
9 MeV, applicator diameter 4.5 cm, bevel 0 degree, protection plate 7 cm



in front of



behind



Mobetron 2000

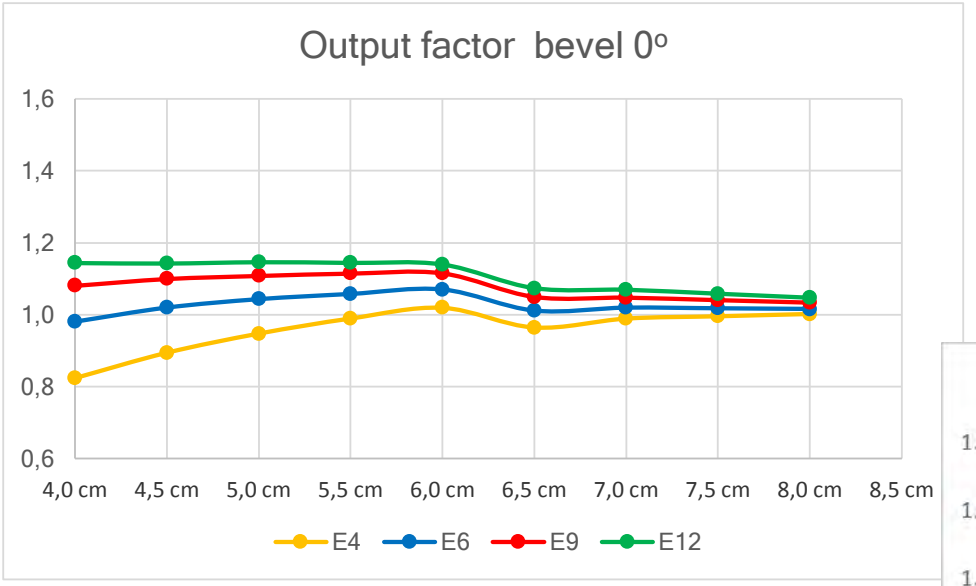
- Applicators: from 4 till 8 cm in steps of 0.5 cm
- Bevel: 0°, 15°, 30° and 45°

- Three electron energies: 6, 9 and 12 MeV
- Head Tilt: +10°/- 30° instead of +30°/- 30°

Output factors

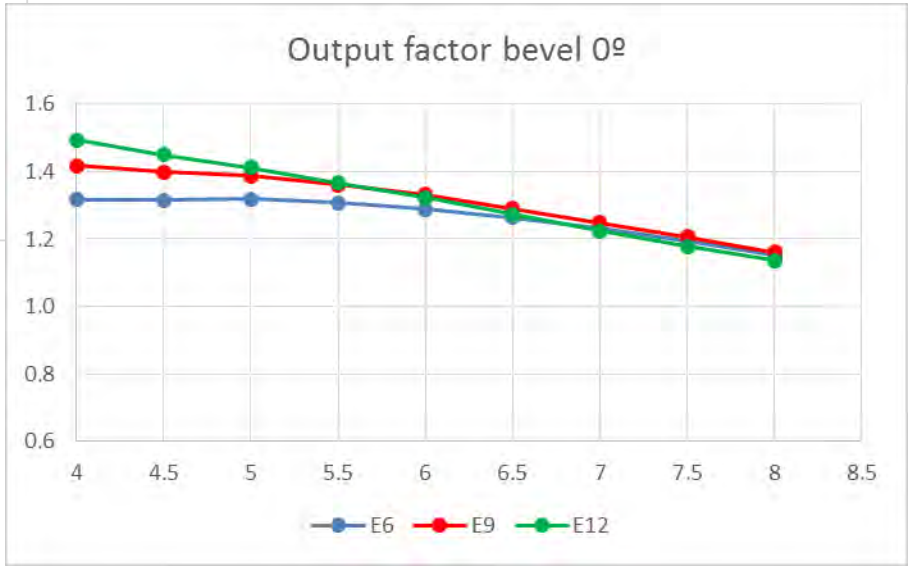
Mobetron 1000

Two piece narrow bore applicators.



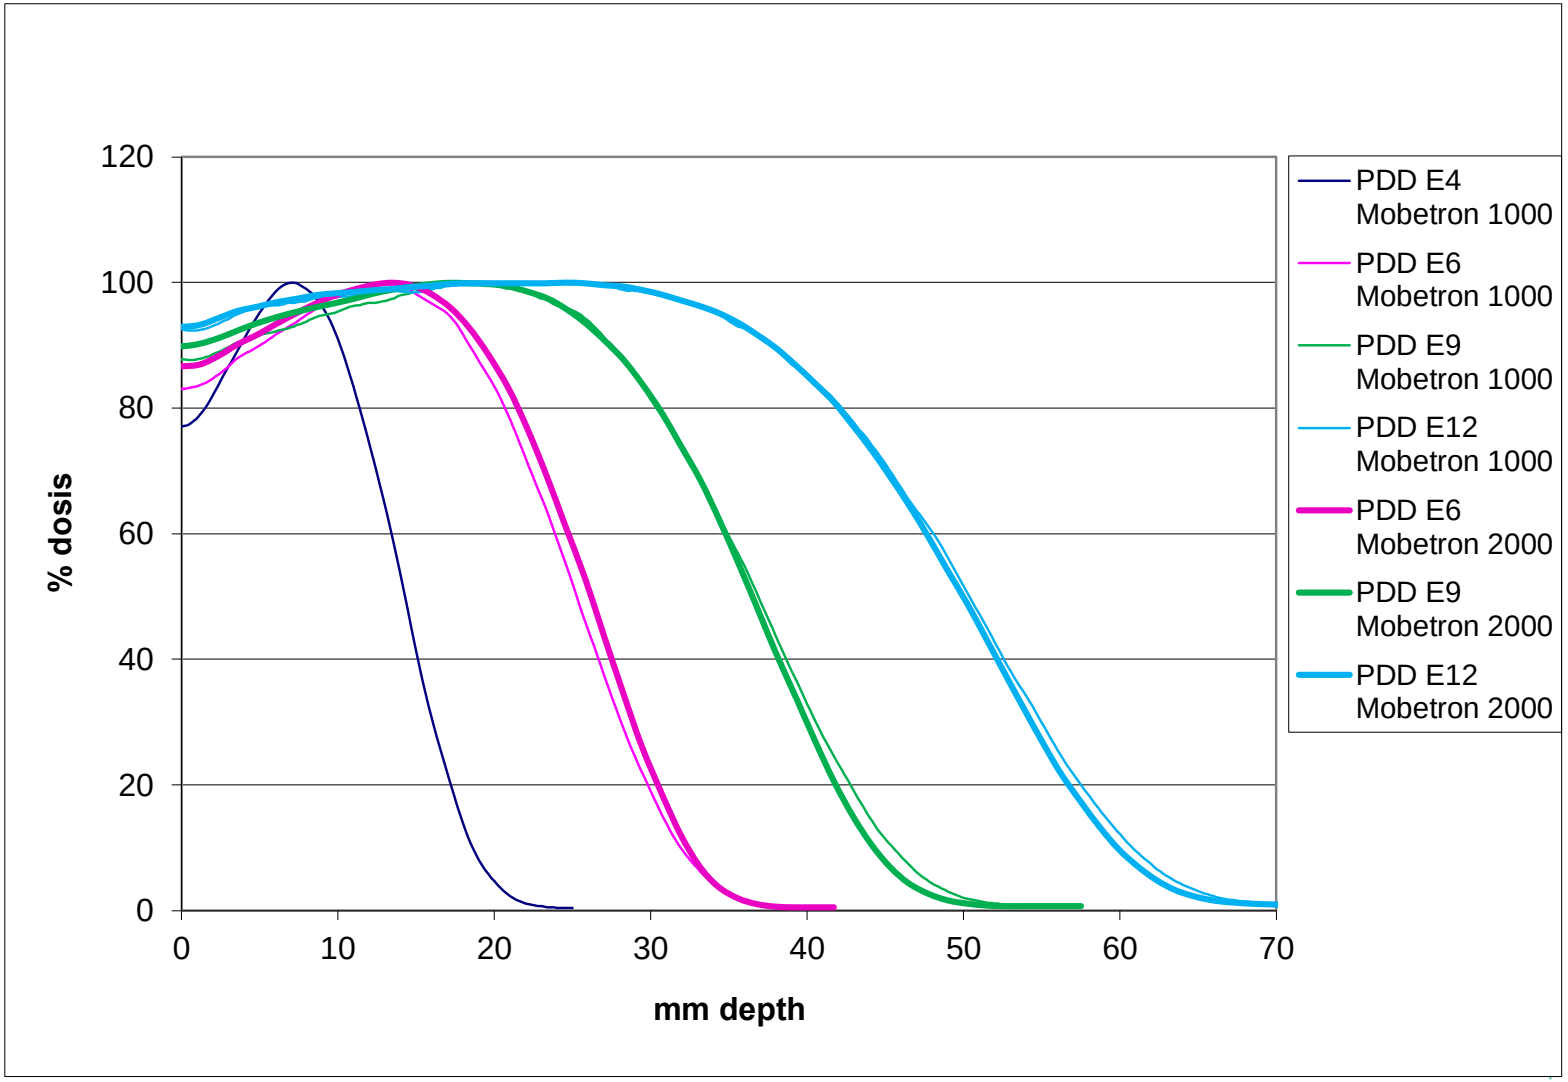
Mobetron 2000

One piece wide bore applicators



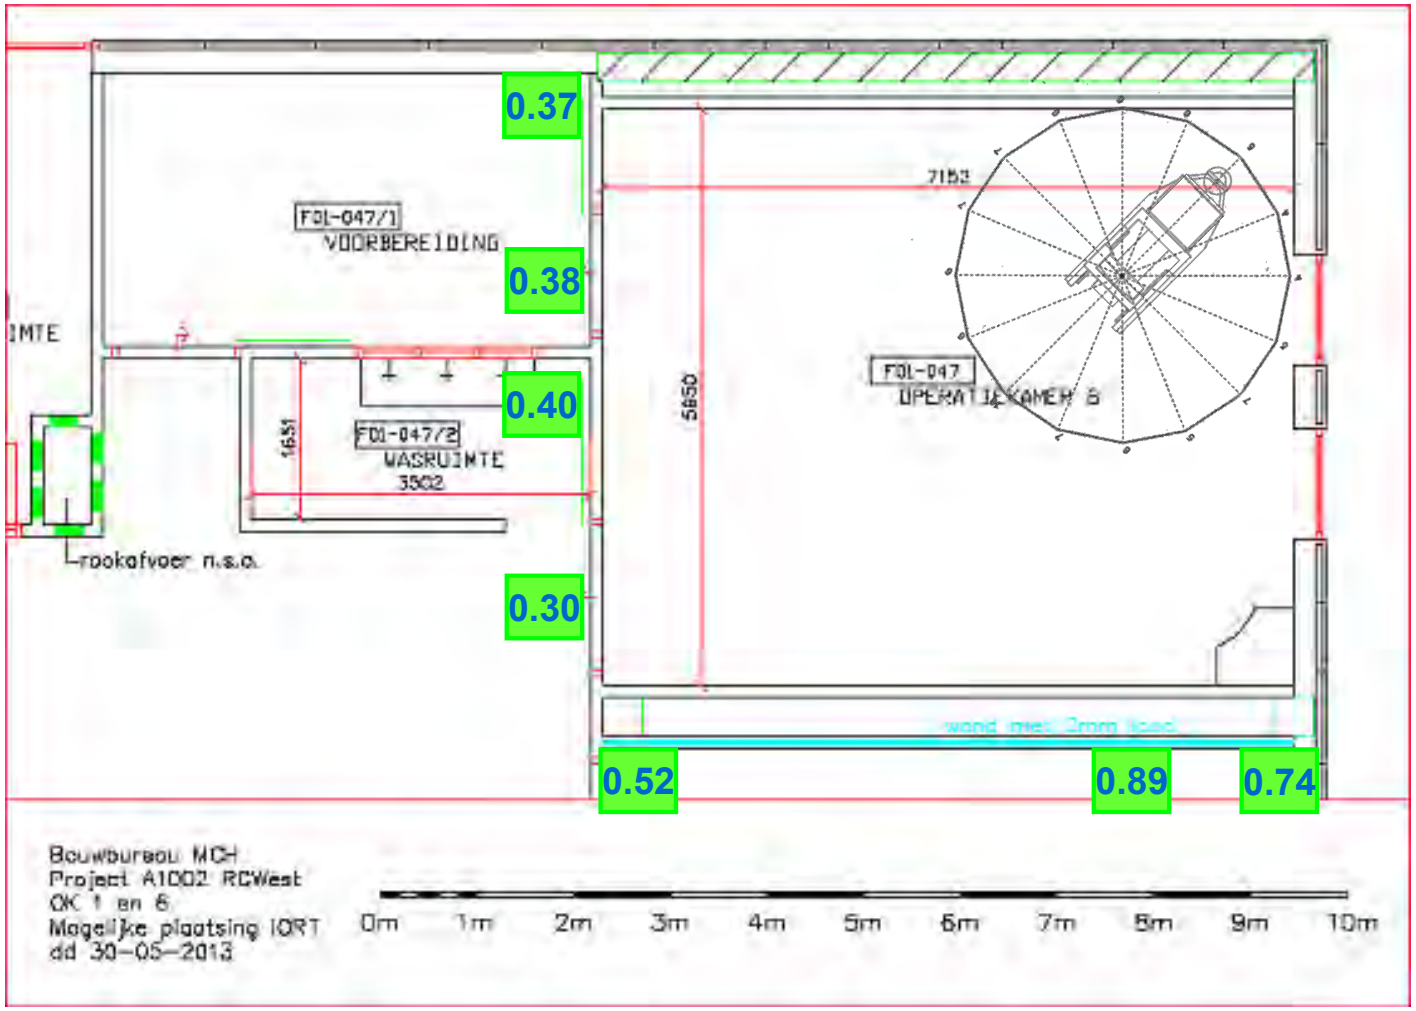
Central axis depth dose profiles

10 cm applicator



Calculated doses around OR

250 APBI and 20 rectal patients per year

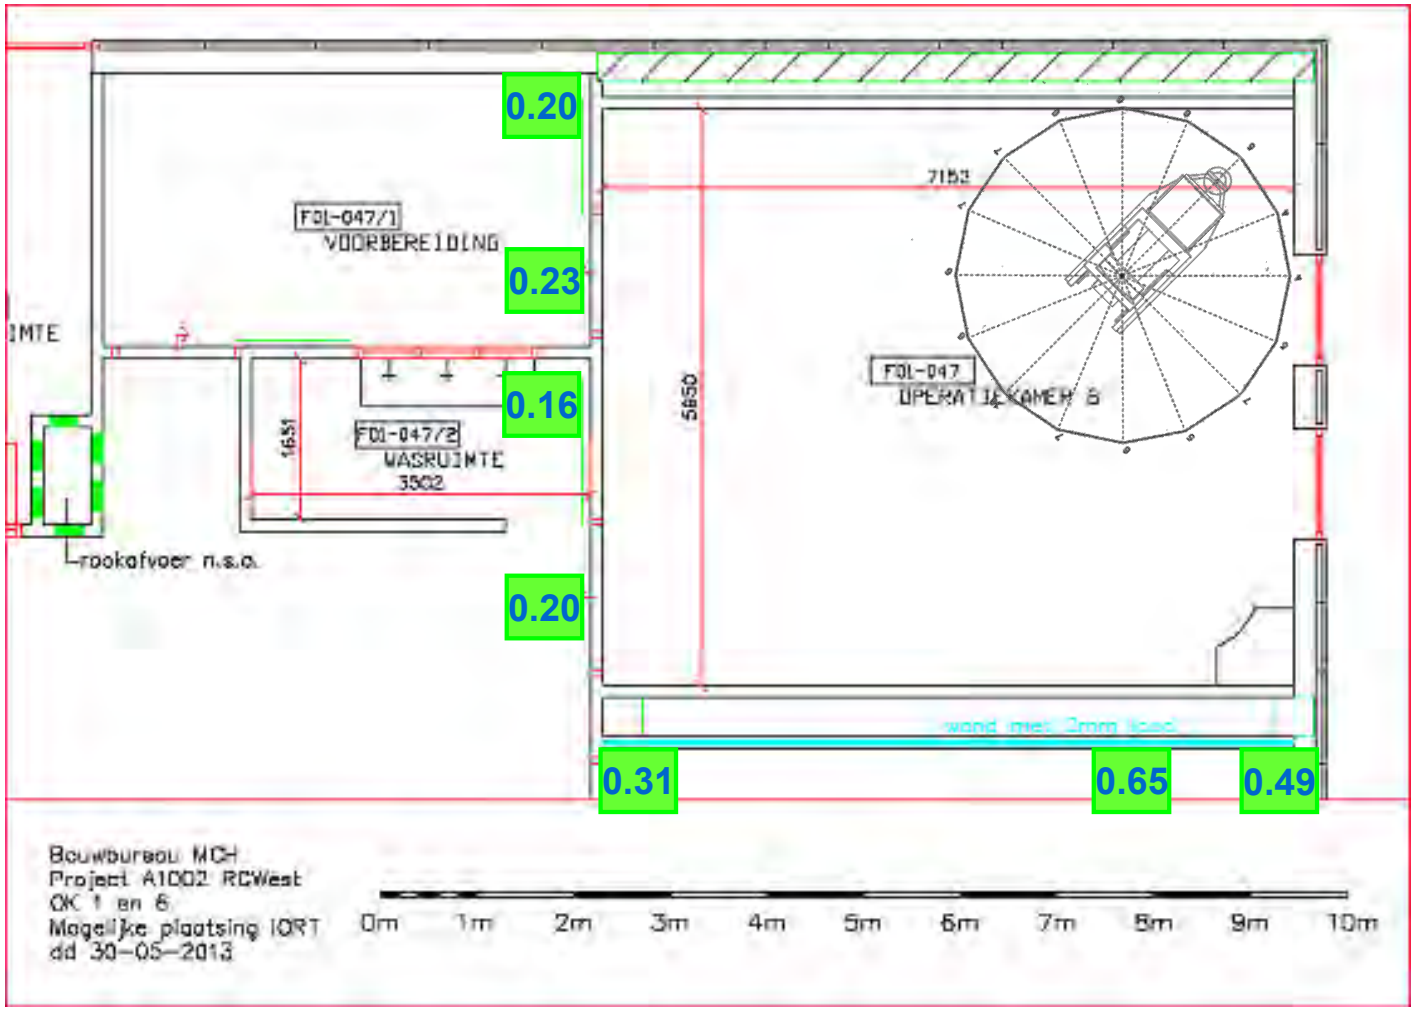


in mSv/year

Dose Limit in The Netherlands: 1 mSv per year

Measured doses around OR

250 APBI and 20 rectal patients per year



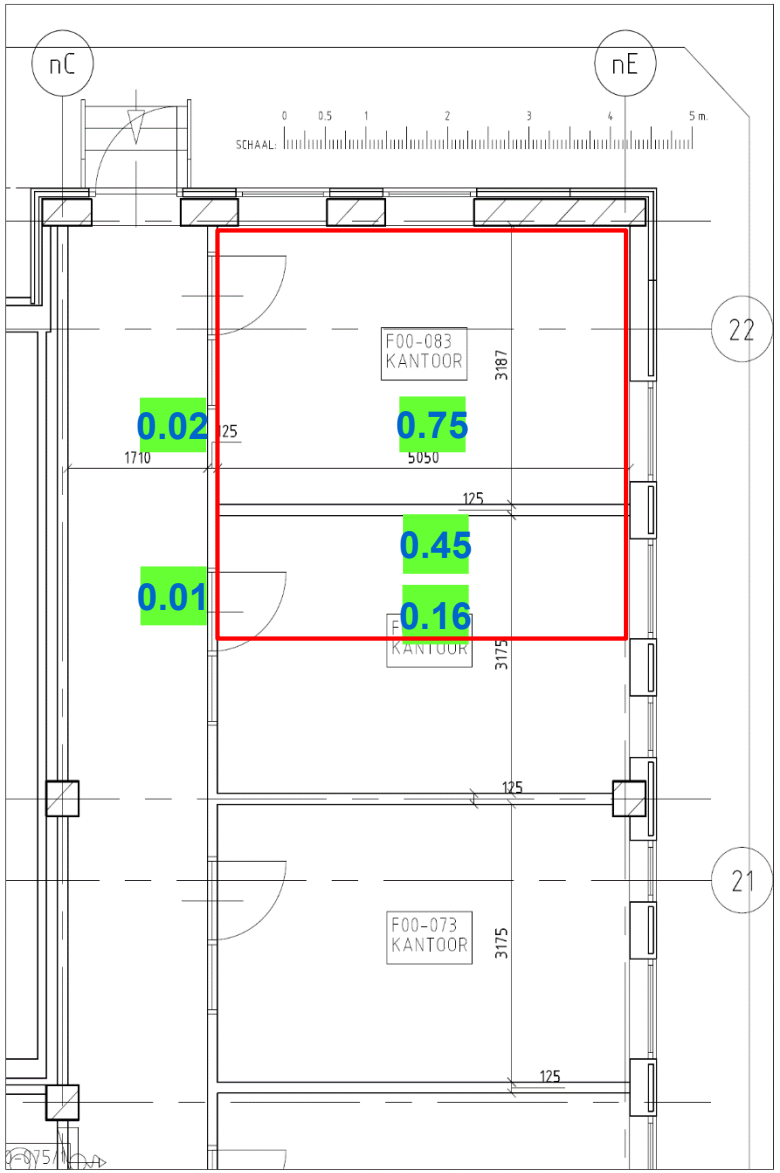
Victoreen 451p survey meter

Dose Limit in The Netherlands: 1 mSv per year

Floor below OR

250 APBI and 20 rectal patients per year

25 cm concrete +
iron plate:
size 5 * 5 m^2
thickness 10 cm



At 3.3 meter:
in mSv/year

50 APBI and 20 rectal patients per year :
25 cm concrete =>
within 1 mSv/year

Conclusions

- We are satisfied with the radiation performance, stability and technical characteristics of Mobetron 2000

- For our workload of 250 APBI and 20 rectal patients per year, we need an iron plate (additional to 25 cm concrete) in the ceiling of the floor below OR to stay within 1 mSv/year.

Future plans

- We will continue using IOERT in breast cancer (APBI and will start using IOERT as a boost) and in rectal cancer.
- Furthermore, we intend to start using IOERT for new tumour sites.

Before and after 12 Gy

	t-Student test
Healthy tissue vs biopsy	p=0.1035
Biopsy vs PIN	p=0.0001
Biopsy vs tumor cells	p=0.0008

"Preliminary" conclusions

- On biopsy specimens: the pro-apoptotic protein **Bax** is significantly less expressed than PIN cells and neoplastic areas after IORT → **before single high dose NO apoptosis**

- After 12 Gy, the pro-apoptotic protein Bax is significantly over-expressed in PIN cells ($p<0.0001$) and neoplastic areas ($p=0.0060$), while it is no expressed differently in healthy tissue → **selectivity in radio - induced damage even for irradiation in one shot, with sparing of healthy tissue**

Within 90-120' single shot, RT would activate mitochondrial apoptosis in tumor and PIN cells.

In our sample, PIN cells seem to be more sensitive to irradiation, in fact, PIN expresses Bax higher than the healthy tissue ($p < 0.0001$), and neoplastic areas ($p = 0.001$)

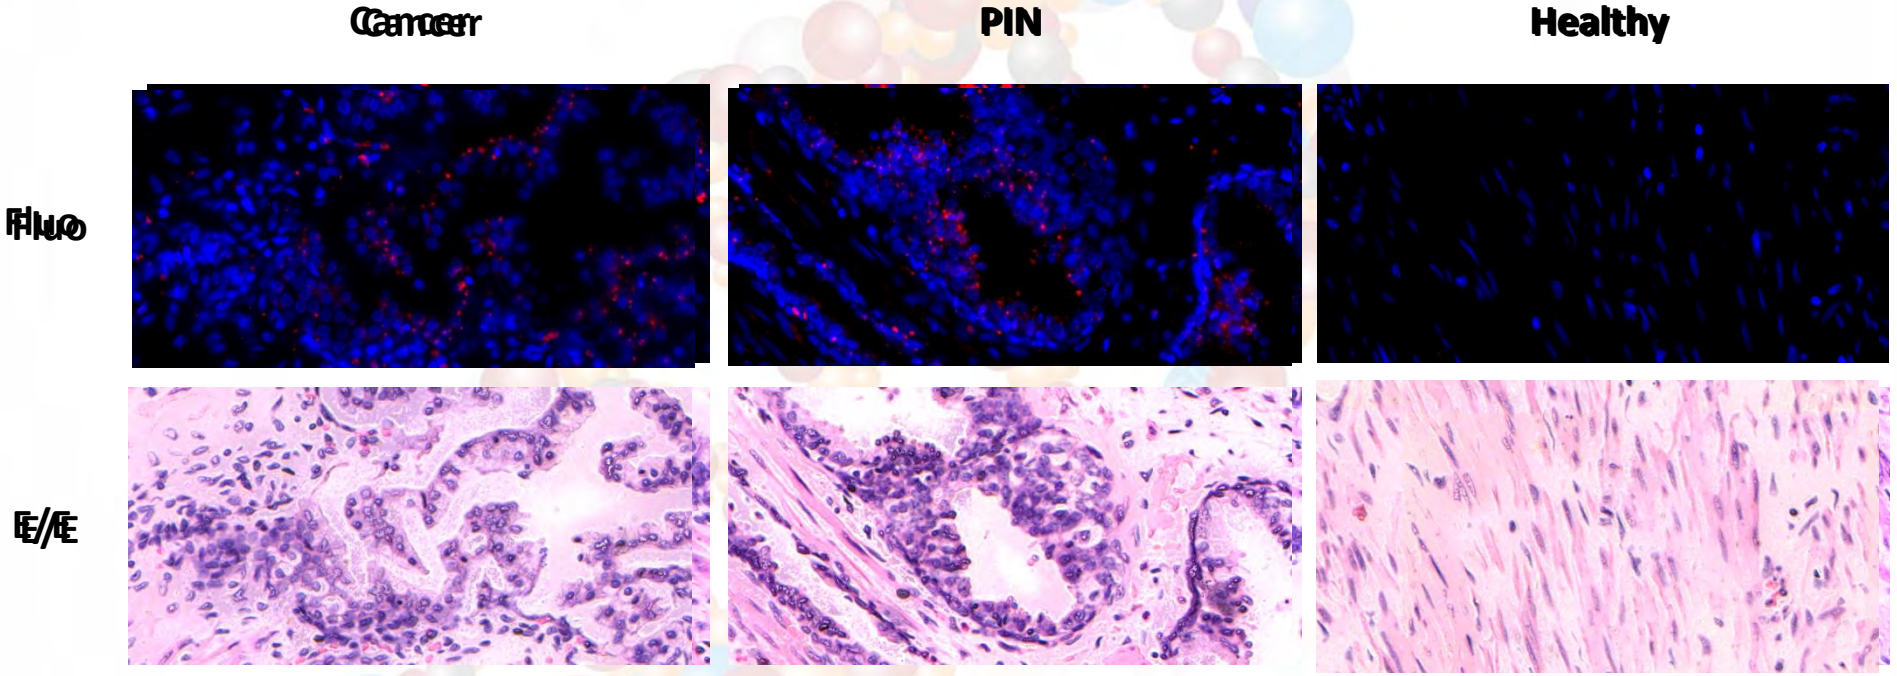
In animal model, it has been demonstrated that pre-neoplastic cells iper-expressed Bax protein.
Overexpression of pro-apoptotic proteins has been explained by the increased turnover in potentially malignant "cells."
However, neoplastic cells ipo-expressed apoptotic proteins because they have acquired "genetic resistance profile"

Xie W. The Prostate 2000

Future elements

Until now, we demonstrated the in vivo mitochondrial apoptosis activation by Bax.

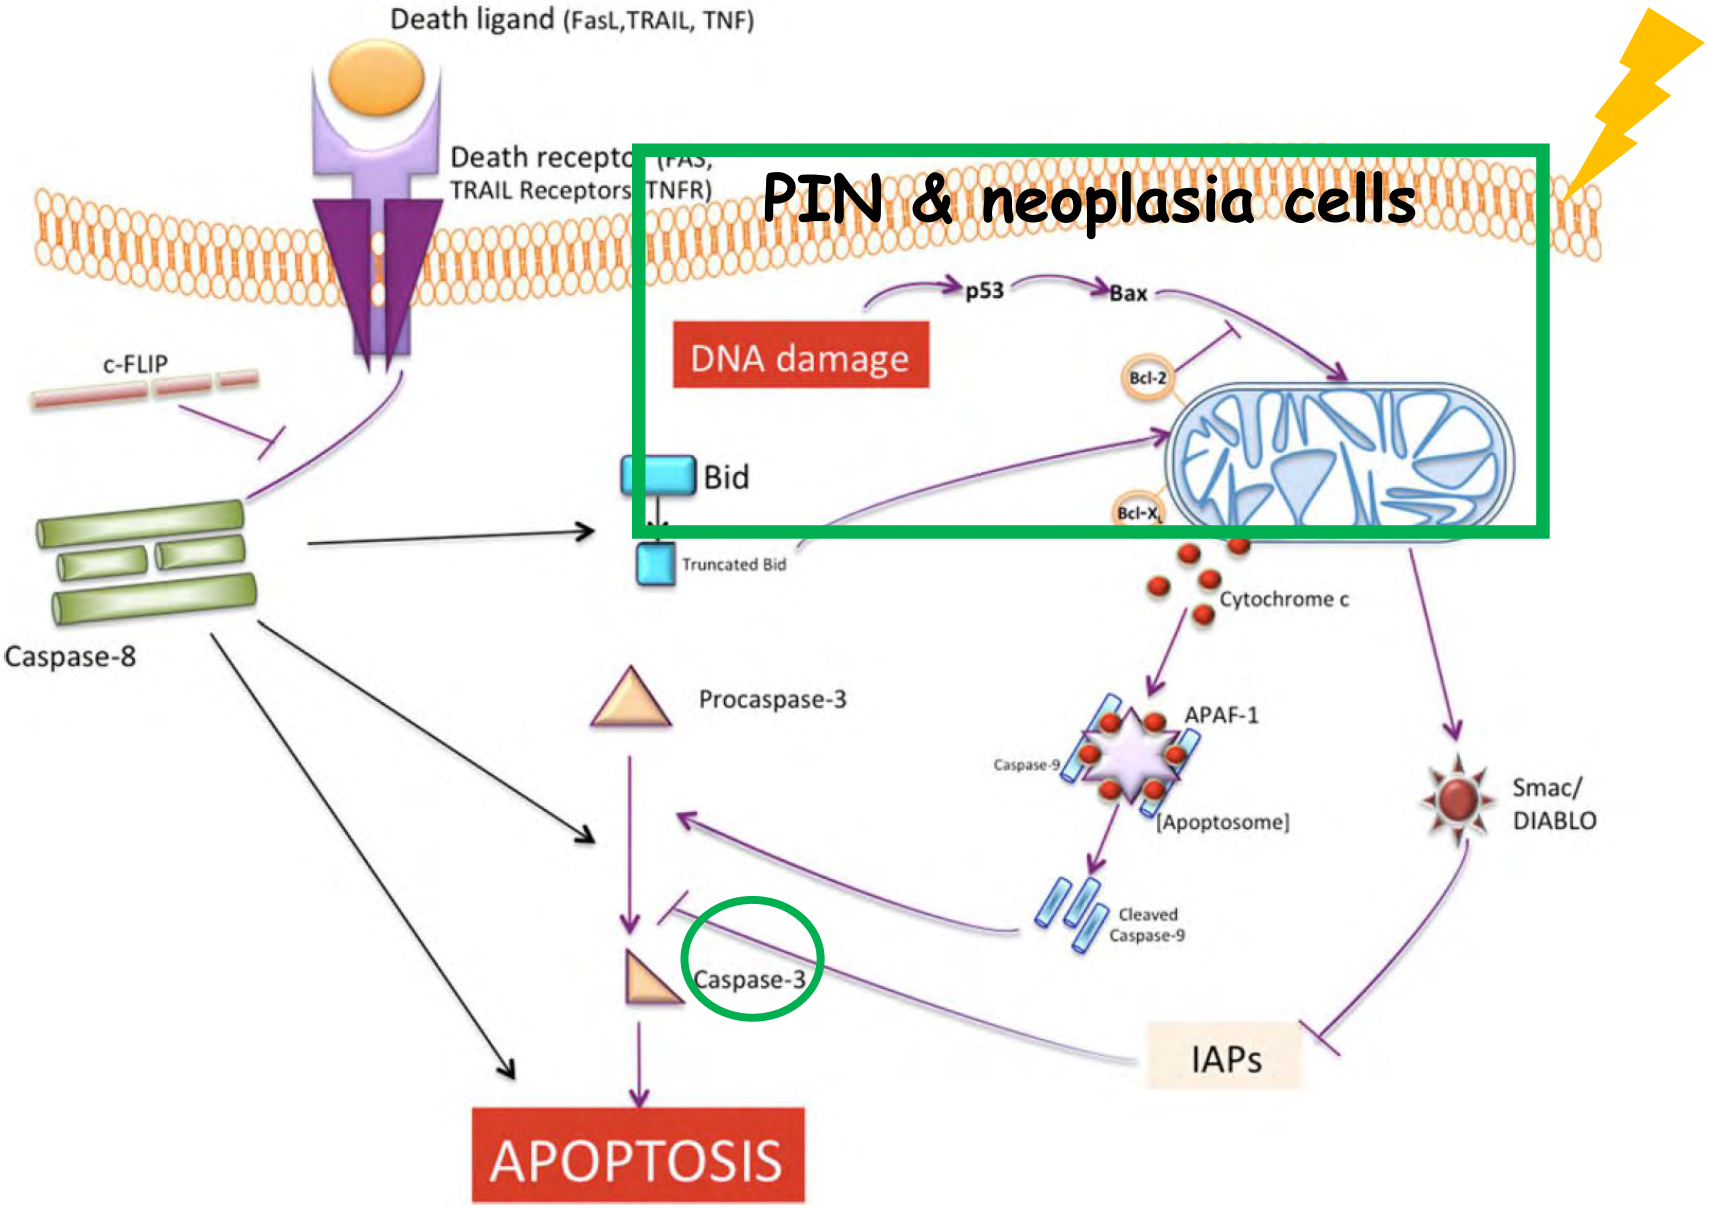
The next step is the evaluation of caspases (3 and 9) pathway.



Preliminary data show as the pathway of caspases is significantly expressed in cancer cells and in the areas of PIN after single shot

Single shot RT & apoptosis: in vivo radiobiological model

12 Gy



INTRAOPERATIVE RADIOTERAPY (IORT) IN THE MULTIMODALITY TREATMENT OF LOCALLY ADVANCED PROSTATE CANCER.

A. Volpe[1], D. Beldì[2], G. Marchioro[1], E. Ferrara[2], M. Billia[1], G. Loi[3], M. Krengli[2]

[1]Urology, [2]Radiotherapy, [3]Medical Physics, University Hospital "Maggiore della Carità", Novara, Italy

PURPOSE: The treatment for locally advanced prostate cancer is still a controversial issue and multimodality approaches can lead to treatment optimization. The aim of this study is to describe technical feasibility and clinical results of intra-operative radiotherapy (IORT) in patients with locally advanced prostate cancer.

MATERIAL /METHODS: A total of 120 patients have been enrolled in the present study thus far. The statistical analysis was performed in 97 patients with follow up > 12 months. Inclusion criteria were patients age < 76 years, KPS > 90 and at least 2 of the following preoperative risk factor: initial PSA (iPSA) > 10 ng/ml, Gleason Score ≥ 7, clinical staging ≥ cT2c according with TNM, probability of organ-confined disease < 25% according to MSKCC nomogram. Median age was 66.9 years (range 51-83), median iPSA was 14.8 ng/ml (range 2.0-154) and median Gleason Score (GS) was 8 (range 4-10). After surgical exposure of the prostate, IORT was delivered by a dedicated linear accelerator (Mobetron, Intraop, Sunnyvale, CA) with 30° beveled collimator, using an electron beam of 9 or 12 MeV to a total dose of 12 Gy. IORT was followed by radical prostatectomy and regional lymph node dissection. Rectal dose was measured "in vivo" by radio-chromic films placed on a rectal probe. All cases with pathological staging≥ pT3a, positive margins (R1) or metastatic lymph nodes (N1) received postoperative external beam radiotherapy (EBRT), delivered to surgical bed with 3D conformal technique or intensity modulated radiation therapy to a total dose of 46-50 Gy (2Gy/fraction). Patients with pT3 or pT4 disease and/or N1 received adjuvant hormonal therapy.

RESULTS: IORT procedure lasted in average 30 minutes (range 15-50). No major intra- or post-operative complication occurred. Median dose to the anterior rectal wall was 4.32 Gy (range 0.06-11.3). Pathological stage was: 30 pT2, 62 pT3, 5 pT4. 59/97 (60,8%) patients were R1 and 38/97 (39,2%) patients were N1. Median post operative PSA was 0.09 ng/ml (range 0-5.05). Post-operative radiotherapy was delivered to 76/97 patients (78.3%) with pathological staging ≥ pT3a or R1. Hormone therapy was prescribed to 63/97 patients (64.9%). Acute toxicity was: 16 G2 (9 GU; 7 GI), 2 G3 (1 GU; 1 GI). Late toxicity was: 11 G2 (5 GU, 6 GI), 4 G3 (2 GU; 2 GI). No G4 acute or late toxicity was observed. Twelve patients died of prostate cancer. With a median follow-up of 70 months (range 12-126), 35/97 patients experienced biochemical failure. Actuarial overall biochemical free survival (BFS) was 60% at 5 years; according to NCCN classification, 5-year BFS was 81% and 55 % in high and very high risk classes, respectively. Of note, no macroscopic failure in the prostate surgical bed was observed.

CONCLUSIONS: IORT during radical prostatectomy is a feasible procedure and allows to deliver safely post-operative EBRT to surgical bed without a significant increase of toxicity. With a median follow-up of 70 months, biochemical control seems to be favourable in particular for high risk patients.

Multi-Institution Phase II Trial of Intraoperative Electron Beam Radiotherapy Boost at the Time of Breast Conserving Surgery with Oncoplastic Reconstruction in Women with Early-Stage Breast Cancer

Jose G. Bazan

Ohio State University

June 25, 2016

Background

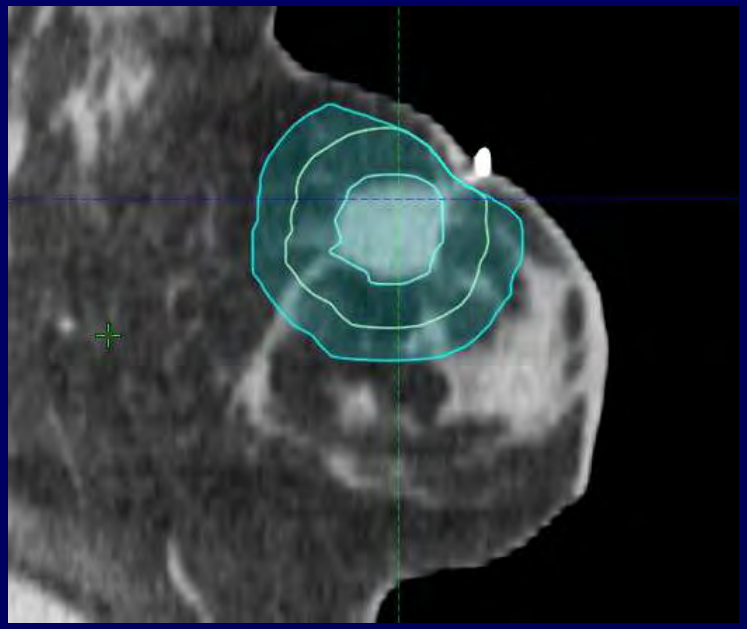
- Randomized trials have demonstrated that lumpectomy cavity boost helps to significantly reduce the risk of ipsilateral breast tumor recurrence

- There remains controversy regarding the exact definition of the boost target volume from an external beam radiotherapy technical planning perspective
  - Contemporary trials define the boost target volume as a 1.7 cm isometric expansion on the lumpectomy cavity

- Delineation of the lumpectomy cavity on CT can be challenging

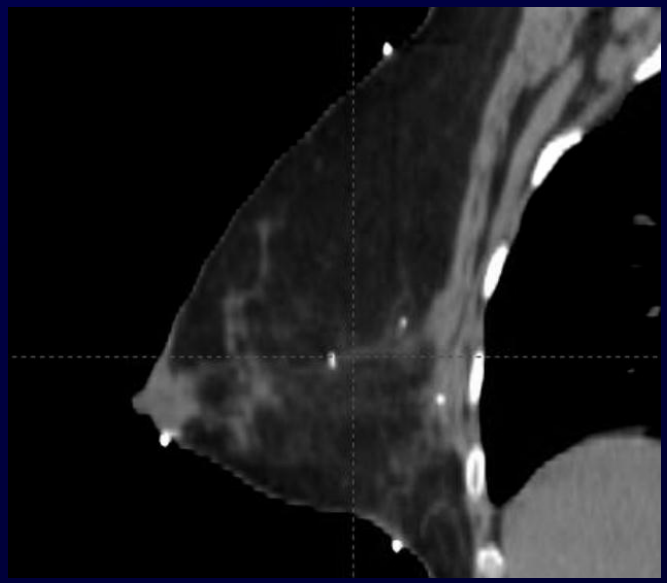
Background

- Oncoplastic techniques are increasingly being used in breast conserving surgery
- Oncoplastic techniques are used to prevent the poor cosmetic results that can occur when a large volume of breast tissue is resected
- In these cases, additional breast tissue is resected and/or rearranged to help provide an esthetically improved breast shape
  - Lumpectomy cavity may be incised and separated with different portions ending up in different quadrants of the resected breast



Standard post-lumpectomy case with well-defined cavity

Patient that underwent oncoplastic reconstruction



Rationale

- Intraoperative radiation (IORT) at the time of lumpectomy but just prior to oncoplastic reconstruction is one strategy to overcome the problem of lumpectomy cavity delineation
  - Allows direct visualization of the surgical cavity
  - Spares the skin of radiation
  - Reduces treatment time by 1-2 weeks

- Retrospective studies have demonstrated extremely low rates of local recurrence using IORT as a boost prior to standard whole breast radiation

- Use of an IORT boost prior to oncoplastic reconstruction are limited to case reports and small series underscoring the need for a prospective clinical trial

Rationale

- IORT boost dose chosen for this protocol is based on biologic effective dose

EBRT	BED3		IORT	BED3
2 Gy x 5	16.7 Gy		6 Gy x 1	18 Gy
2 Gy x 6	20 Gy		7 Gy x 1	26.7 Gy
2 Gy x 7	23.7 Gy		8 Gy x 1	29.3 Gy
2 Gy x 8	26.7 Gy		10 Gy x1	43.3 Gy

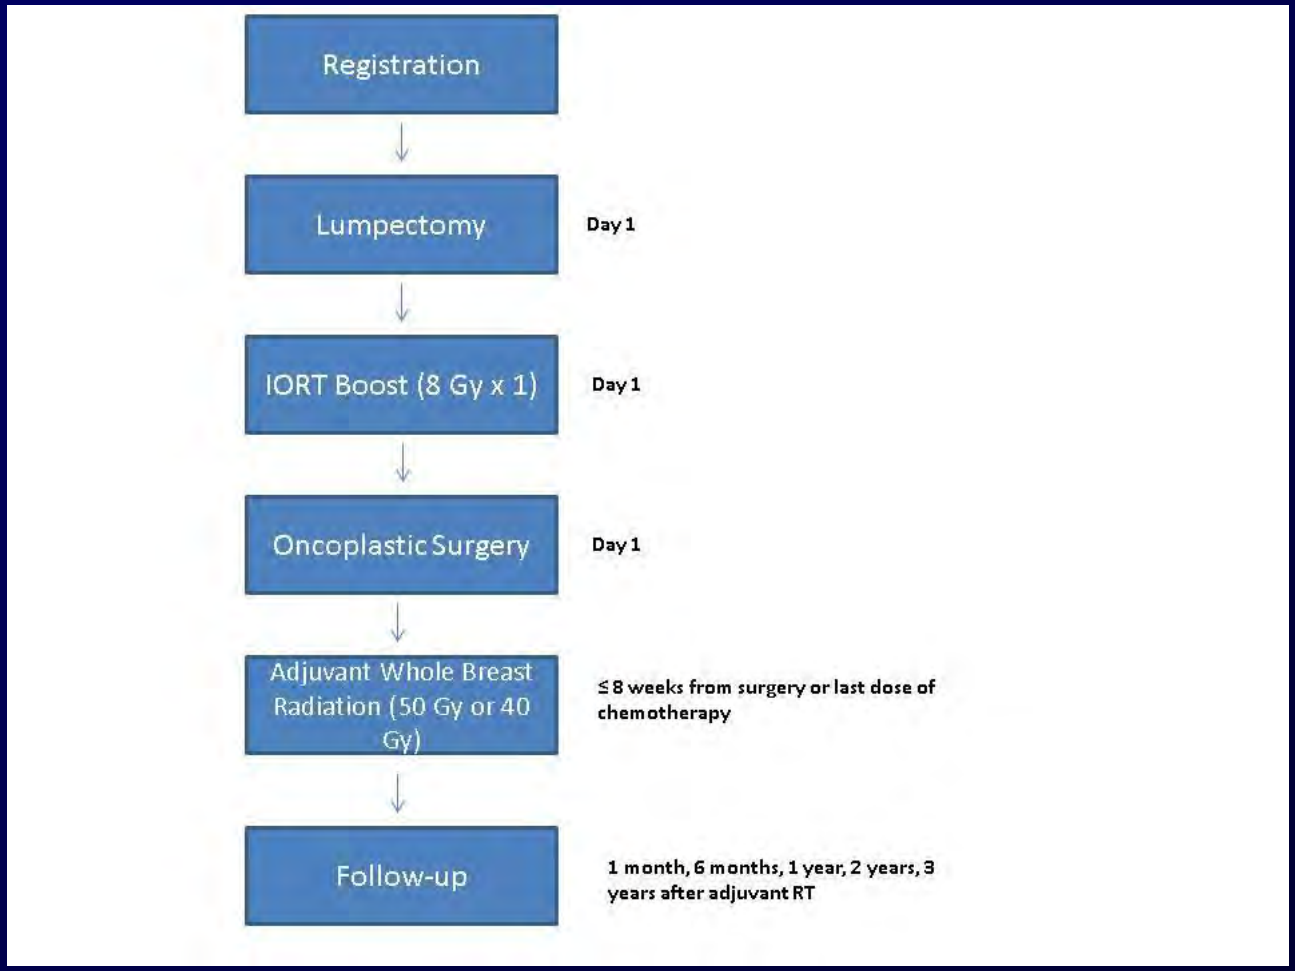
Chosen for protocol

Reported in literature

Hypothesis

- The rate of grade 3 fibrosis in women receiving IORT boost followed by whole breast radiotherapy will be ≤5% at 1 year from the end of treatment

Study Schema



Endpoints

- Primary Objectives
  - To determine the rate of grade 3 breast fibrosis at 1 year in women undergoing lumpectomy with oncoplastic reconstruction and immediate IORT boost followed by adjuvant whole breast radiation therapy

LENT SOMA Scale for Breast Fibrosis

Grade 1: Barely palpable, increased density

Grade 2: Definite increased density and firmness

Grade 3: Very marked density, retraction and fixation

Endpoints

- Secondary Objectives
  - To determine the rate of 5 year ispilateral breast tumor recurrence rate
  - To determine the change in self-reported cosmesis using the BCTOS cosmesis scale
  - To determine the change in physician-reported cosmesis

BCTOS Scale (PRO)

	Difference between treated and untreated breast and area			
	None	Slight	Moderate	Large
1. Breast size.....	1	2	3	4
2. Breast texture (hardening)	1	2	3	4
3. Arm heaviness.....	1	2	3	4
4. Nipple appearance.....	1	2	3	4
5. Shoulder movement	1	2	3	4
6. Arm movement	1	2	3	4
7. Breast pain.....	1	2	3	4
8. Ability to lift objects.....	1	2	3	4
9. Fit of shirt sleeve.....	1	2	3	4
10. Breast tenderness.....	1	2	3	4
11. Shoulder stiffness.....	1	2	3	4
12. Breast shape.....	1	2	3	4
13. Breast elevation (how high the breast is).....	1	2	3	4
14. Scar tissue.....	1	2	3	4
15. Shoulder pain.....	1	2	3	4
16. Arm pain.....	1	2	3	4
17. Arm swelling.....	1	2	3	4
18. Breast swelling.....	1	2	3	4
19. Arm stiffness.....	1	2	3	4
20. Fit of bra.....	1	2	3	4
21. Breast sensitivity.....	1	2	3	4
22. Fit of clothing.....	1	2	3	4

Harvard Breast Cosmesis Scale

1. Excellent	When compared to the untreated breast, there is minimal or no difference in the size or shape of the treated breast. The way the breast feels (its texture) is the same or slightly different. There may be thickening, scar tissue, or fluid accumulation within the breast, but not enough to change the appearance.
2. Good	There is a slight difference in the size or shape of the treated breast as compared to the opposite breast or the original appearance of the treated breast. There may be some mild reddening or darkening of the breast. The thickening or scar tissue within the breast causes only a mild change in the shape or size.
3. Fair	Obvious difference in the size and shape of the treated breast. This change involves one-quarter or less of the breast. There can be moderate thickening or scar tissue of the skin and the breast, and there may be obvious color changes.
4. Poor	Marked change in the appearance of the treated breast involving more than one-quarter of the breast tissue. The skin changes may be obvious and detract from the appearance of the breast. Severe scarring and thickening of the breast, which clearly alters the appearance of the breast, may be found.

Key Eligibility Criteria

- Women aged ≥ 18 yrs AND ≤60 yrs (women routinely boosted)
- Stage I or II
- Multifocal disease is allowed if intent is to undergo resection through a single lumpectomy incision

Key Ineligibility Criteria

- T4, N2 or N3, M1 or pathologic stage III/IV breast cancer
- DCIS only
- Intention to administer neoadjuvant chemotherapy prior to resection
- Prior radiotherapy to the breast or prior radiation to the region of the ipsilateral breast that would result in overlap of radiation fields

Safety/Feasibility Component

- First 30 patients will be used to determine the safety
  - Evaluated by the rate of surgical complications necessitating hospital admission or return to the operating room within 30 days of surgery+IORT
  - Greater than 15% incidence rate will be considered unacceptable

Halt if Number of Complications is equal or more than	Total Patients Treated
4	10
7	20
9	30

Sample Size Determination for Primary Endpoint

- Primary endpoint of the study is grade 3 fibrosis at 1 year with a hypothesis that the rate will be ≤ 5%
- A rate of 9% or more will be considered unacceptable

Non-inferiority proportion	Actual Proportion	Target alpha	Actual Alpha	Sample Size	Power
9%	3%	0.05	0.0474	100	82%
9%	4%	0.05	0.0479	158	82%
9%	5%	0.05	0.0496	266	82%

Assuming 10% dropout rate, sample size is 176 patients

Accrual

- Estimated accrual is projected to be 8 per month (in the multi-institutional setting) with a ramp up period in the first 6 months
- Estimated time to complete accrual is approximately 24 months

Study Calendar

Assessments	At or Prior to Study Entry – Pre IORTb/Surgery (Registration)	Prior to Start of Adjuvant RT (Post IORTb/Surgery)	Last Day of Adjuvant RT	1 Month After RT Completion	6 Months After RT Completion	1 year After RT Completion Then Annually x 5 years

INTRAOPERATIVE RADIOTHERAPY DURING RADICAL PROSTATECTOMY FOR LOCALLY ADVANCED PROSTATE CANCER: TECHNICAL AND DOSIMETRIC ASPECTS

MARCO KRENGLI, M.D.,* CARLO TERRONE, M.D.,† ANDREA BALLARÈ, M.D.,* GIANFRANCO LOI, PH.D.,‡ ROBERTO TARABUZZI, M.D.,† GIANSILVIO MARCHIORO, M.D.,† DEBORA BELDÌ, M.D.,* ELEONORA MONES, PH.D.,‡ CESARE BOLCHINI, R.T.,* ALESSANDRO VOLPE, M.D.,† AND BRUNO FREA, M.D.§

Departments of *Radiotherapy, †Urology, ‡Medical Physics, University Hospital Maggiore della Carità, Novara, Italy; and §Department of Urology, Hospital S. Maria della Misericordia, Udine, Italy

Table 1. Preoperative characteristics of study patients

No. of patients	38
Age, y, median (range)	67 (56–76)
Karnofsky performance status, mean	90
Initial PSA (ng/ml), median (range)	39.5 (2.9-63.9)
Biopsy Gleason score	
<7	5 (15%)
≥7	33 (85%)
Clinical stage* (TNM 2002 classification)	
≤T2c	11 (29%)
>T2c	27 (71%)
Neoadjuvant hormone therapy	11 (29%)

* Based on digital rectal examination, transrectal ultrasound, and abdominal computed tomography.

Table 3. Acute toxicity after postoperative external beam radiotherapy according to the Radiation Therapy Oncology Group scale (13)

Toxicity	G0 patients, *n* (%)	G1 patients, *n* (%)	G2 patients, *n* (%)
Gastrointestinal toxicity	22/27 (81.5%)	2/27 (7.5%)	3/27 (11%)
Genitourinary toxicity	25/27 (93%)	1/27 (3.5%)	1/27 (3.5%)

IOERT, electrons of 9 to 12 MeV
Total dose of 10-12 Gy.
Rectal dose measured in vivo by radiochromic films placed on a rectal probe (Mean 3.9 Gy).

No major intra- or postoperative complications oc- curred. Minor complications were observed in 10/33 (30%) of cases.

IORT DURING RADICAL PROSTATECTOMY

STUDY DESIGN

Phase II, non randomized, single arm trial
July 2005 – ongoing
Tertiary referral academic center
Joint team of radiation oncologists and urologists

Inclusion criteria

- High/very high risk Pca patients according NCCN
- Age $\leq$76y
- Primary Bx Gleason Score $\geq$ 4
- Presenting PSA>20 ng/ml
- Probability of organ confined tumour<25% (MSKCC nomogram)

Exclusion criteria

- unfit for surgery
- ASA score>3
- History of BID
- Previous prostate EBRT /BRT
- bone and/or visceral mets

TECHNIQUE

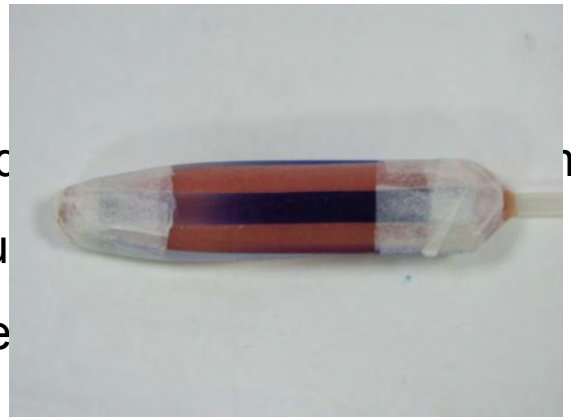
Rectal probe (12 cm, diam. 2.5 cm)

4 radio-chromic films positioned on the surface

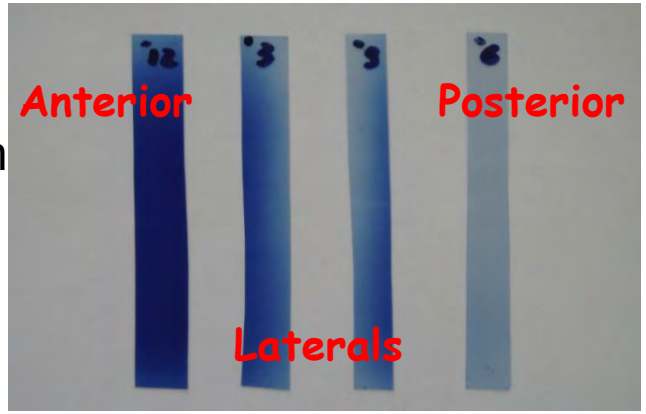
ec

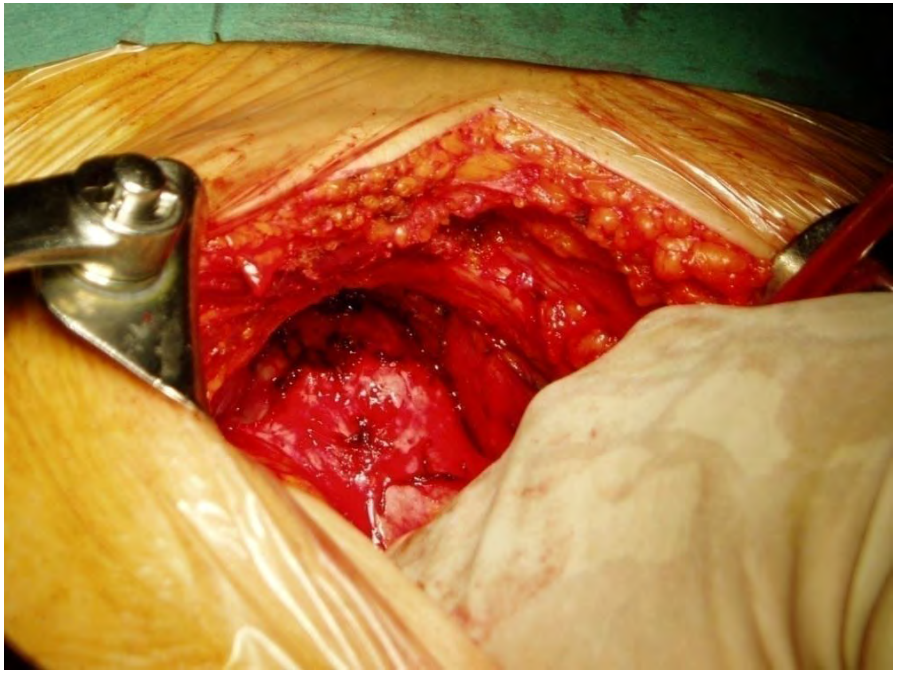
cu

se



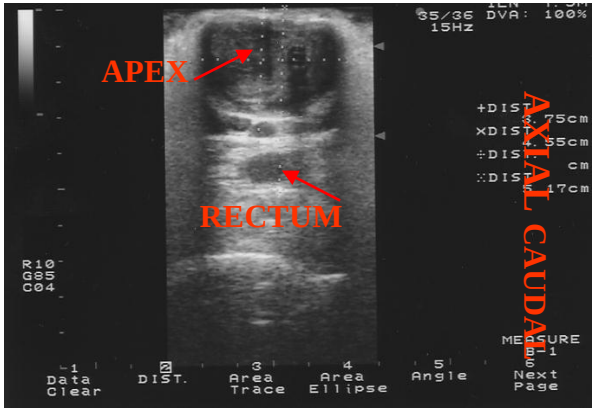
m

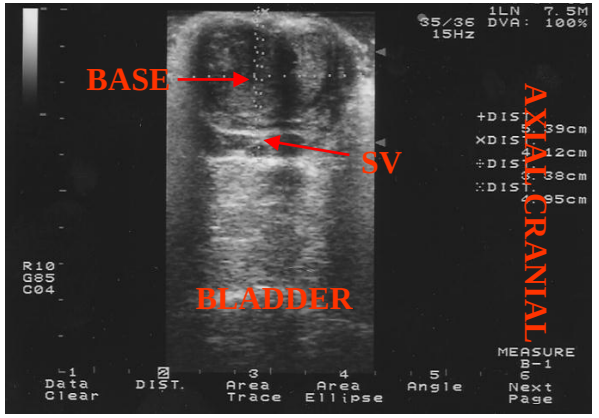


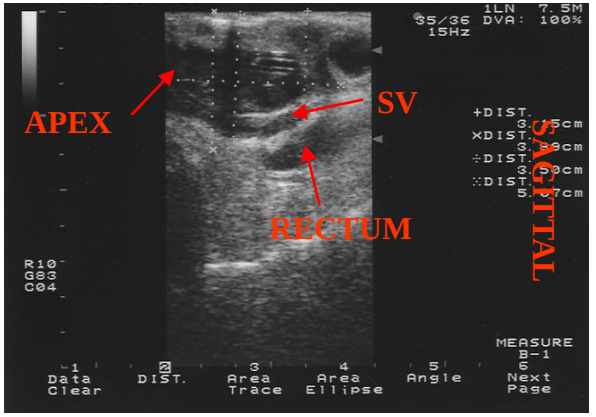


IORT TECHNIQUE

Intraoperative ultrasound



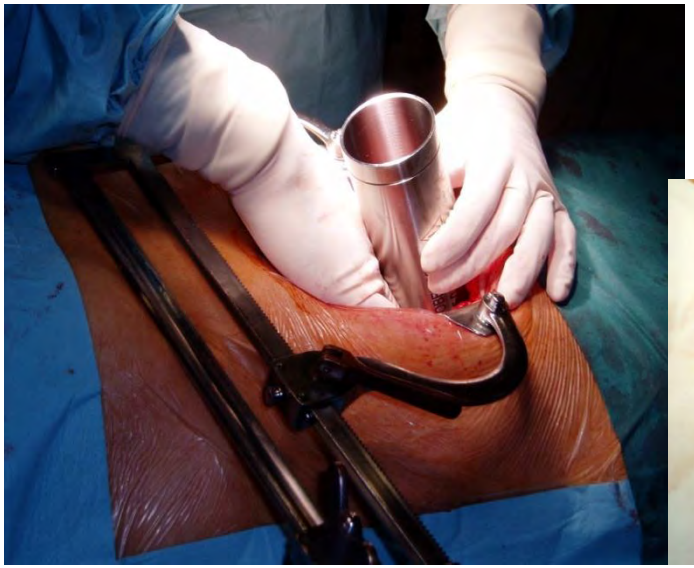


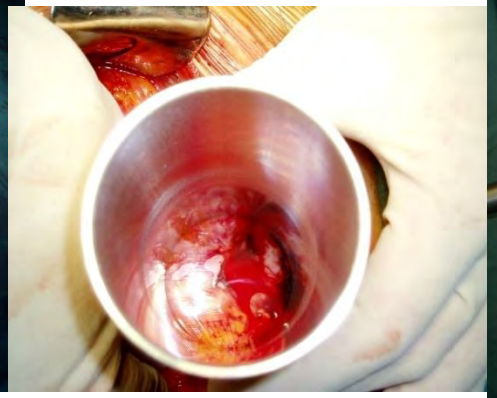


Ultrasound is mandatory to choose delivered beam energy

- 9 MeV (47%)
- 12 MeV (53%)

IORT TECHNIQUE

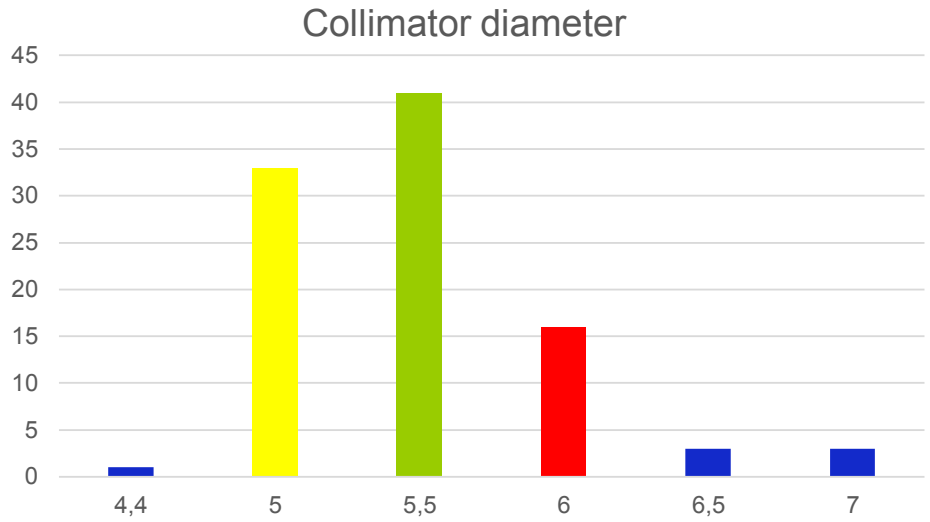




IORT target:

Prostate *plus* a surrounding margin of 0.5-1 cm

IORT



Collimator angulation:

30° (97%); 15° (3%)

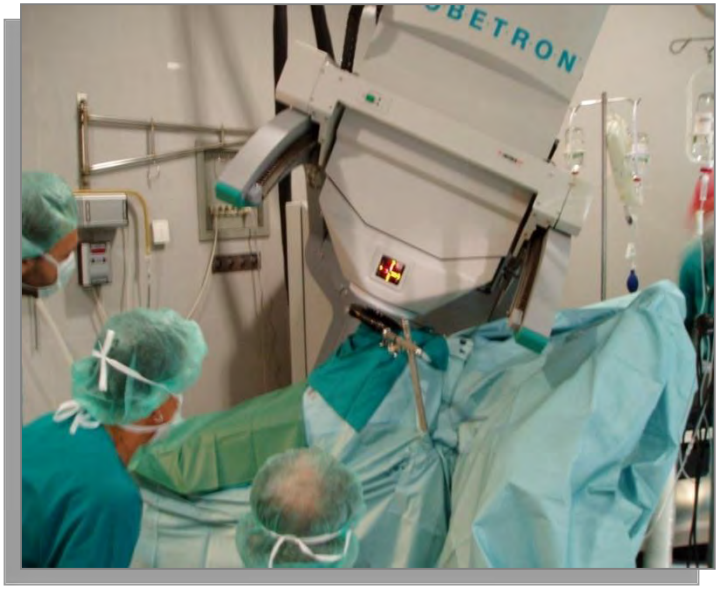
Mobile Linac: Mobetron, Intraop

Energy: 9 MeV (47%) - 12 MeV (53%)

Target Dose: 12 Gy (90% isodose)

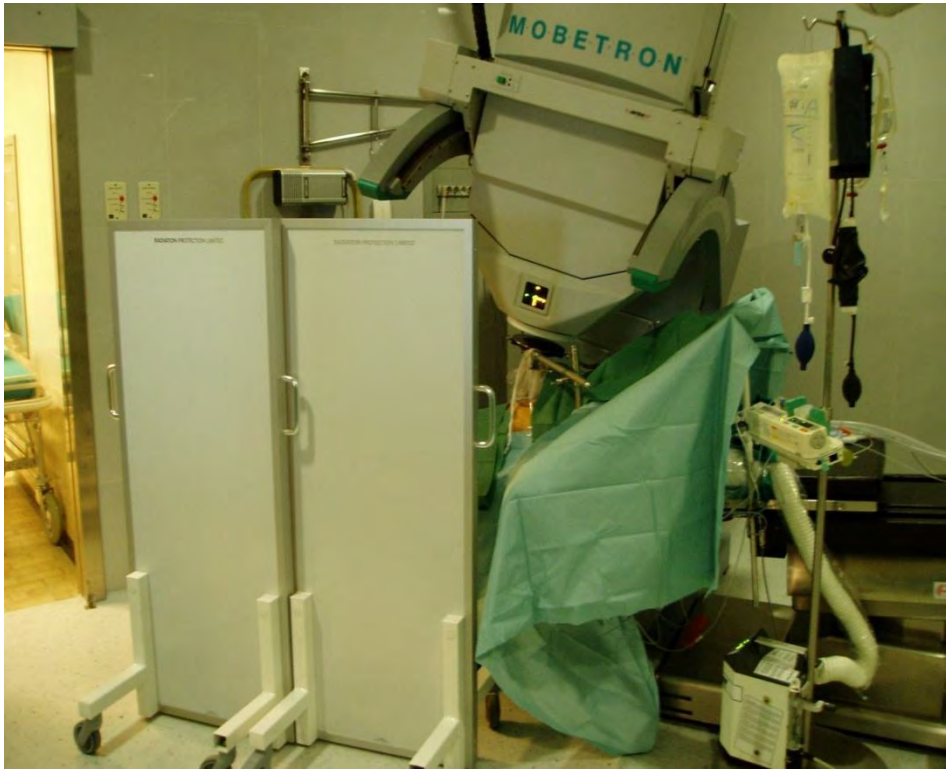
Median IORT time is 30 min (range 15-40 mins)

IORT – SOFT DOCKING



An air gap is maintained between collimator and nozzle

The bladder is outside the target avoiding the risk of traumatizing the tissues with movements of the machine



RESULTS

- 122 patients enrolled
- 97 patients with minimum follow-up of 12 mo

BASELINE CHARACTERISTICS

PARAMETER	VALUE
Age (years)	66.9 (51-83)
PSA at Bx (ng/ml)	14.8 (2.0-154)
Gleason Score sum Bx	8 (6-10)
Positive cores (n)	10/12 (8-12)
Prior ADT - Bicalutmide 150 mg - LHRH agonist	31/97 (32%) 90.3% 9.7%

RESULTS

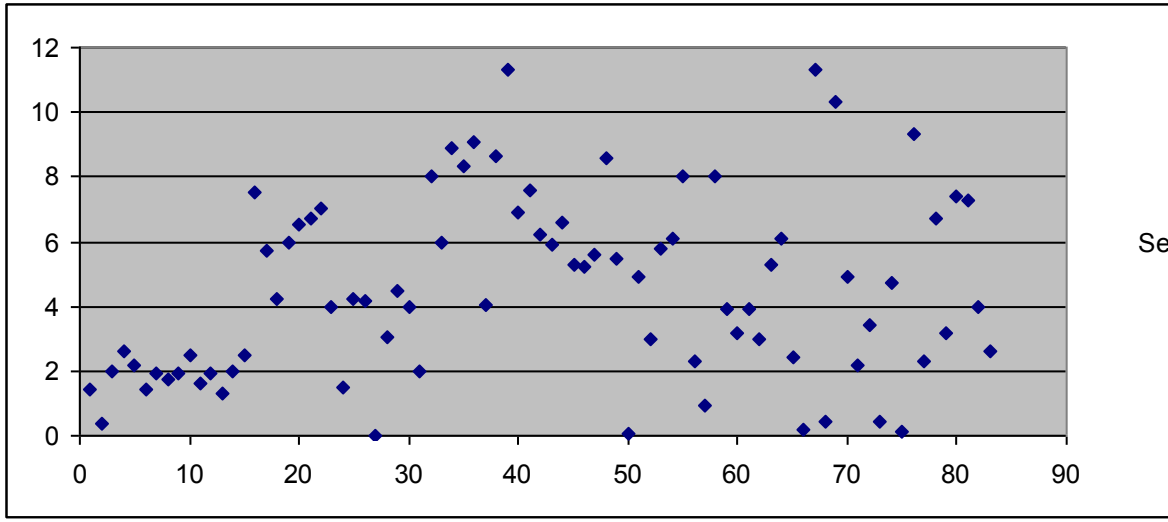
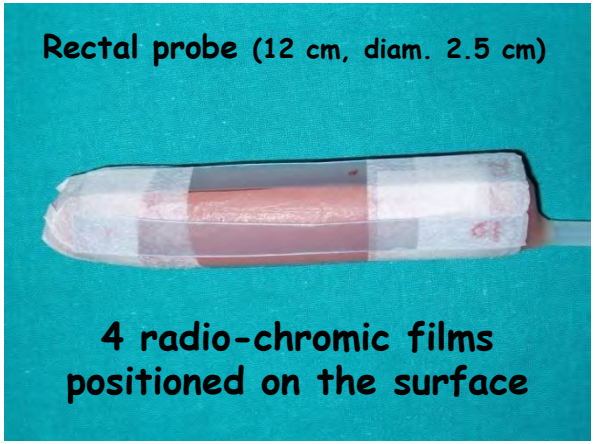
Adjuvant ADT prescribed to 63/97 patients (64.9%). (pT3/4 N1)

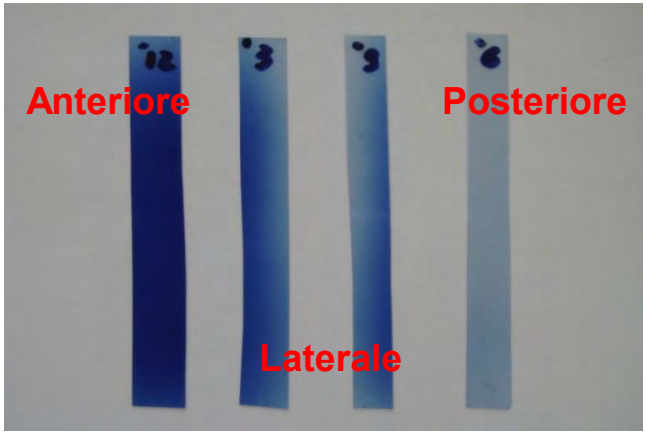
IN VIVO DOSIMETRY

Median dose to rectal wall **4.35 Gy**

(range: 0.06-11.3 Gy)







PERIOPERATIVE SURGICAL OUTCOMES (30 days)

Mean operative time was 167 mins (range 140-195 mins)

Event	n;%	Management	Clavien grade
Lymphocele	8 (8%)	Observation	I
Arythmia	1 (1%)	ITU care + monitoring	IVa
OVERALL	94 (100%)		

At a median follow-up of 70 mo (range 12-126)

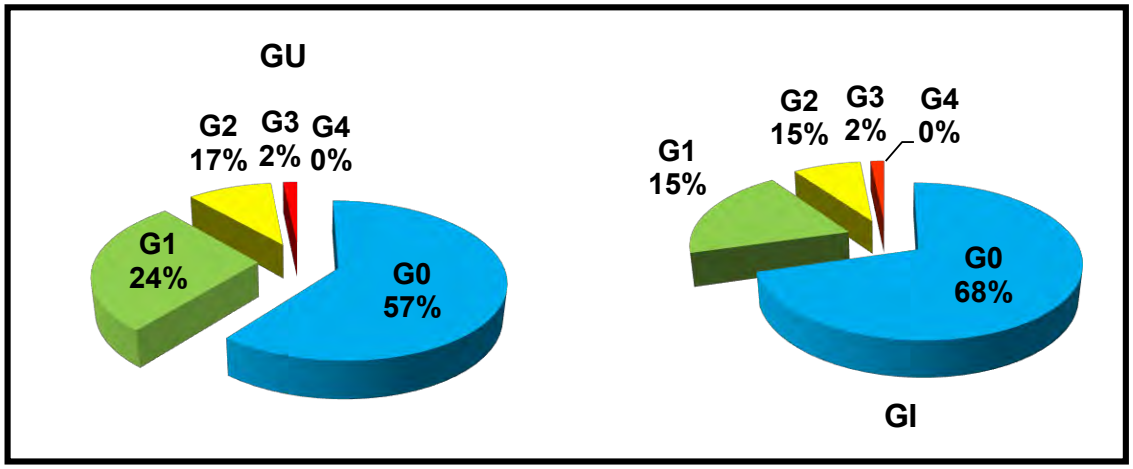
- 75% pts are continent (0-1 safety pad)
- 21% mild-moderate incontinence
- 4% severe incontinence

No acute rectal or bladder toxicity related to IORT

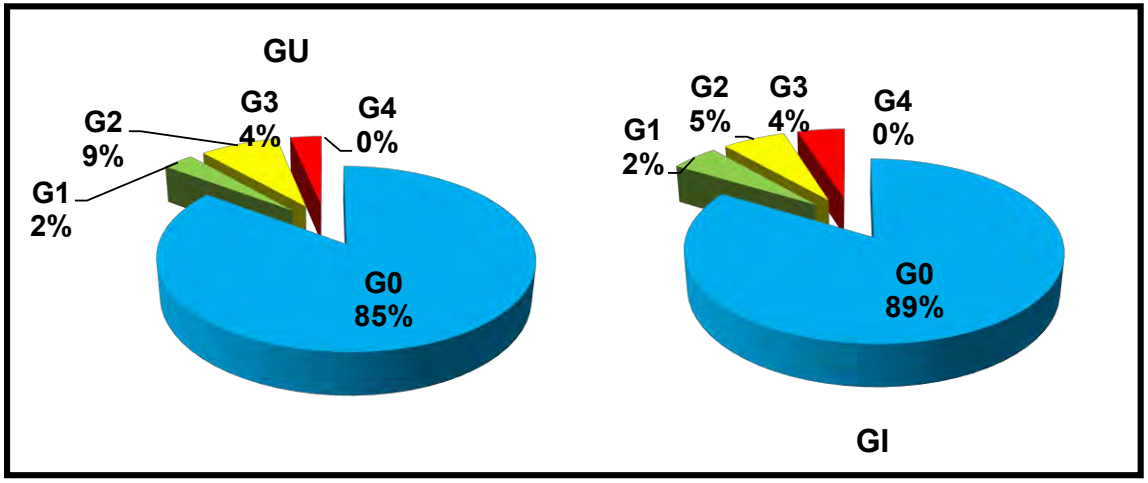
Dindo D. Ann Surg 2004

POSTOPERATIVE EBRT OUTCOMES (76/97 pts – 78.3%)

Early

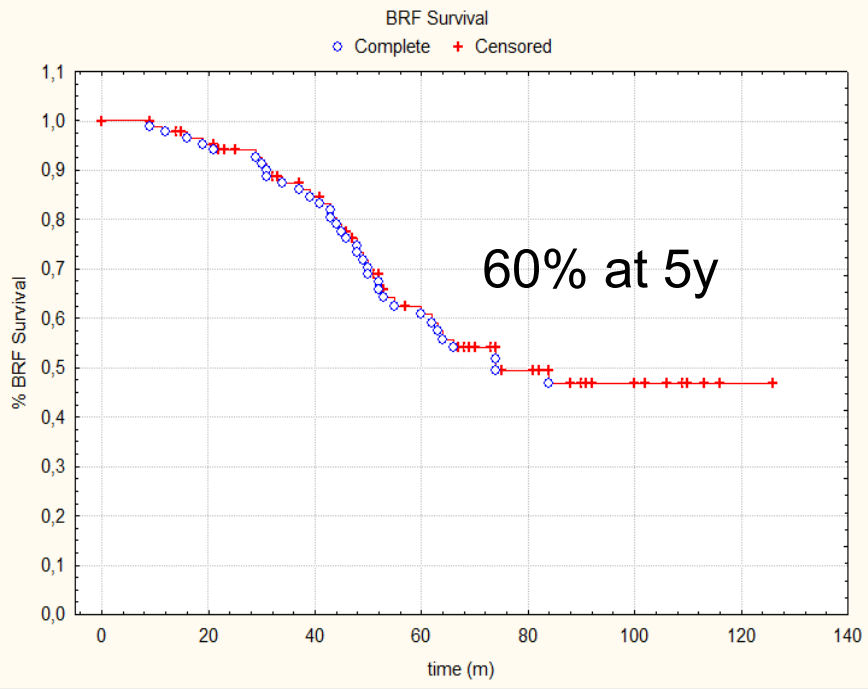


Late



ONCOLOGICAL OUTCOMES: BRFS

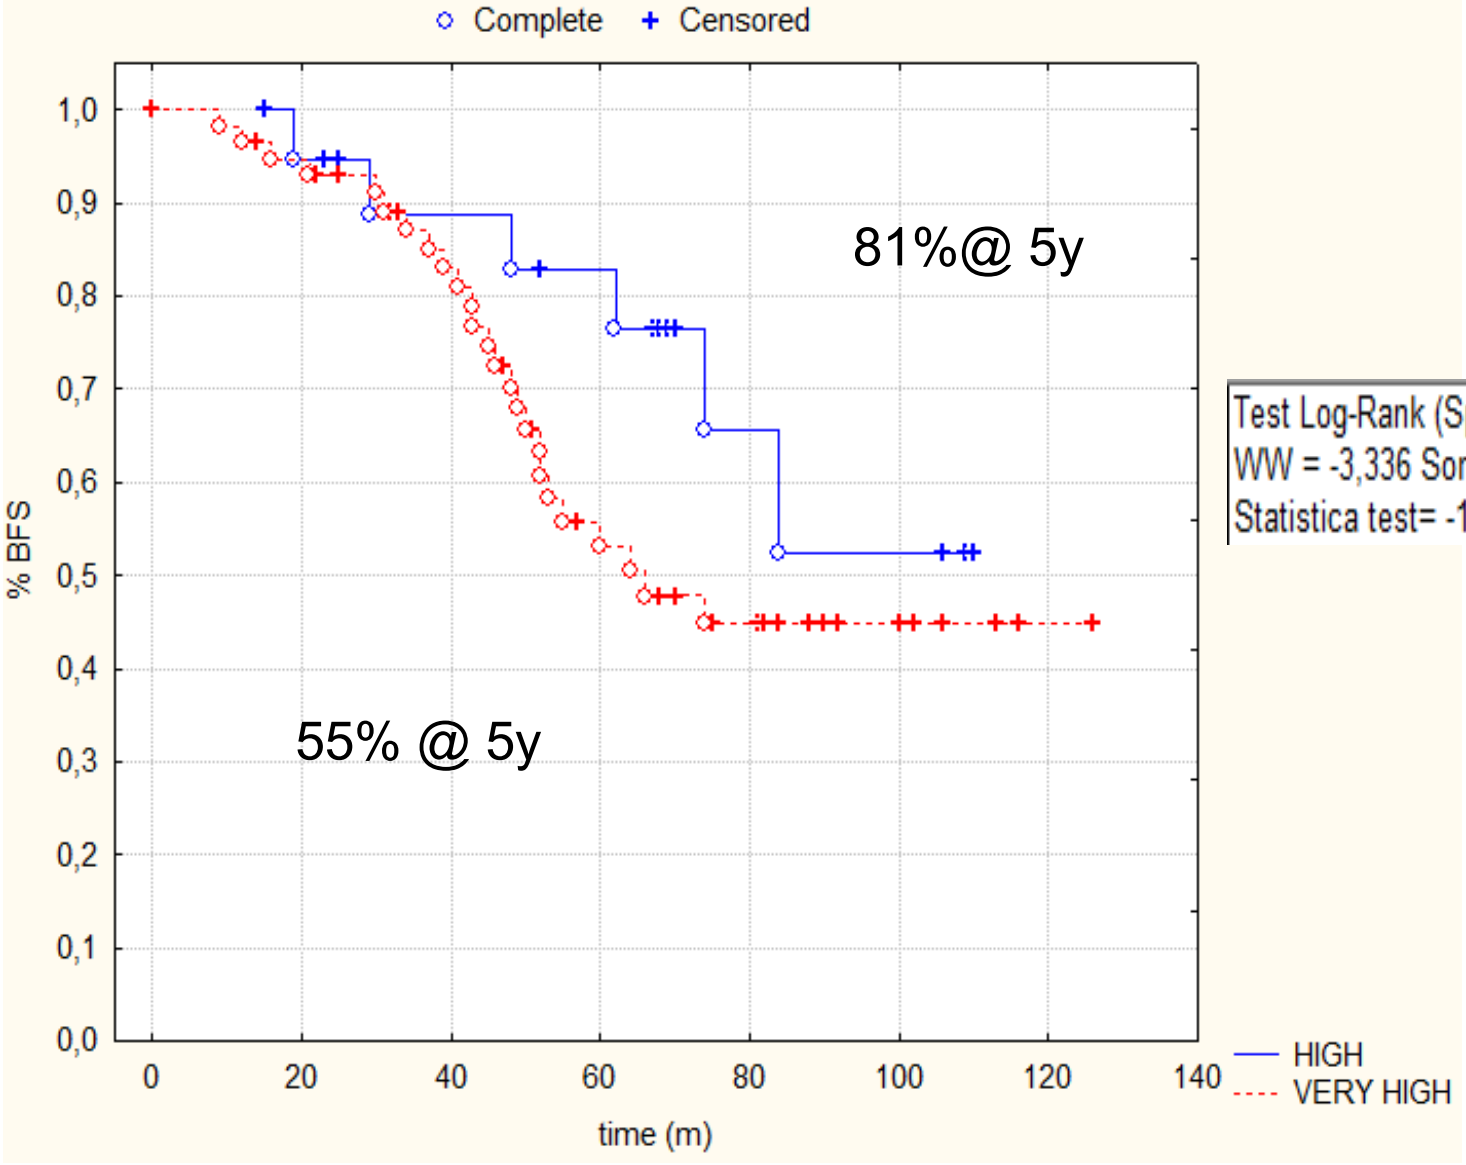
Biochemical failure: PSA ≥ 0.2 ng/ml



Median follow-up 70 months
(range 12-126)

	N° (%)
Lymph node recurrence	6/35 (17.2%)
Bone M+	2/35 (5.7%)
Lung M+	1/35 (2.8%)
Brain M+	1/35 (2.8%)

OS according to NCCN risk categories



CONCLUSIONS

∞ Radiobiological data (low **alfa/beta**) are supporting the use of high dose per fraction

∞RP and IORT **is feasible**, with relatively low morbidity (no acute rectal toxicity IORT-related)

∞ Study strenghts: largest reported series with prospective clinical and oncological outcomes

∞ Study limitations: median follow-up is <10y, a few patients received preoperative ADT, local staging with MRI is missing in early cases

∞ Open issues:

- Improved patient selection
- IORT as a single therapy vs boost prior to EBRT
- What adjuvant EBRT regimen? Hypofractionation?

Background

- **HIOB: IOERT 11 Gy + 15 x 2.7 Gy WBI**

- *Rationale for Hypofractionation:*
  Canadian and START-Trials (UK)
- *Rationale for IOERT Boost (10 Gy):*
  European Pooled Analysis (BIO-Boost): LRR 0.13 % / Jahr [Radiotherapy Oncology 2013]

Design:

- Sequential probability ratio test, SPRT
- One armed, multicentric, prospective trial

Primary Endpoint: „Local Control“

Superiority/equality of HIOB in comparison to „Gold Standard“:

Matching/exceeding the best published results for LR rates in 3 different age groups after *5 year observation* in terms of an

- ***upper limit*** *(exceeding = inferiority) and a*
- ***lower limit*** *(undershooting = superiority/equality).*

Sequiential probability Ratio Test - SPRT

	annual rate %	5-year rate %	
▪ ***Age > 50 :***	**0.7**	**3.5 (Bartelink)**	→ **upper limit (tolerated)**
	0.4	**2.0 (START B)**	→ **lower limit (best published)**
▪ ***Age 41-50 :***	**1.2**	**6 (Bartelink)**	
	0.72	**3.6 (Whelan)**	
▪ ***Age 35-40:***	**2**	**10 (Bartelink)**	
	0,72	**3.6 (Whelan)**	

Further Endpoints

Secondary Endpoints

- Disease free survival

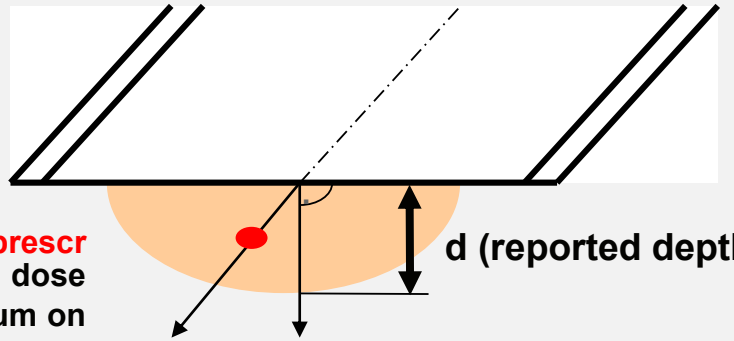
Tertiary Endpoints:

- acute toxicity : CTC-Sxcoring system
- late toxicity: LENT-SOMA
- Cosmesis: 5-Point-Scoring System (van Limbergen)

Inclusion criteria

- Inv. breast Carcinoma
- Age: ≥ 35
- T-status: T1-2
- N-status: N0-1
- R0-Resection
- All Grade G1-G3, all HR and Her-2 status
- Neoadjuvant/adjuvant therapy: No limits

IOERT



(Central beam axis –geometric tube axis)

- **PTV-Definition:**

  3D Volume of at least 2 cm beyond the former macroscopic tumor edge. ***Procedure:*** Without skin, “dose-limit” at rib-surface: 5 (-7) Gy

- **IOERT Dose: 11.1 Gy Dmax** on the central axis
- **PTV encompassed by 90%** of the prescribed dose (i.e. **10 Gy**)

WBI and Start of treatment

Day 36-56 post OP

- Adjuvant Chemotherapy:
  Up to 9 mths

WBI only (no RNI)

- **2.7 Gy (ICRU) x 15 (5 Fx/week)**

Status: 10/15 (Start: 13.01.2011)

ʻation and Call for Abstracts Registr

Isiort Registry

We invite all ISIORT members to contribute to the **ISIORT Registry,** that is currently the largest collection of treatment data of IORT procedures. This registry has so far collected about 9000 cases from 36 collaborating centres, also serving to identify partners for future collaborative clinical trials. Updates are repeatedly published, with all contributing centers in authorship!

Do not hesitate to fill in your data send them to krengli@med.unipmn.it

IORT as single shoot 18 - 21 Gy
72.6% enrolled in protocols

Perspectives

• The number of collaborating centers increased over time from 3 in 2007 to 21 in 2011, to 34 in 2014 and to 42 in 2016.

• These data are a report on a large clinical experience of patients treated with IORT worldwide and gives an overview on practice oriented patients selection.

• Further data analysis could focus on single tumor types and highlight specific clinical and technical issues. F/U data could also be included to analyze survival outcome

• The collected data could serve as a basis for designing prospective clinical trials in an effort to define the contribution of IORT in tailored multimodality approach.

ISIORT pooled analysis 2016 update: clinical and technical characteristics of intraoperative radiotherapy in 10,675 patients

Purpose:
Data from centres active in intraoperative radiotherapy (IORT) were collected within the International Society of Intraoperative Radiotherapy (ISIORT) program. The purpose of the present analysis was to analyse and report the main clinical and technical variables of IORT performed by the participating centres.

Materials and Methods:
In 2007, the ISIORT-Europe centres were invited to record demographic, clinical and technical data relating to their IORT procedures in a joint online database.

Results:
The numbers of centres increased from 3 centres in 2007 to 42 centres and 10,675 IORT procedures have been recorded until May, 2016. Median age of patients was 55.2 years (range: 5 months – 89 years). Gender was female in 80.2% of cases and male in 19.8%. Treatments were curative in 10,482 cases (98.2%) and 2,545 (23.8%) cases were included in study protocols. The most frequent tumour was breast cancer with 8,075 cases (75.6%) followed by rectal cancer with 913 cases (8.6%), soft tissue and bone sarcomas with 345 cases (3.2%), prostate cancer with 164 cases (1.5%), gastric cancer with 120 cases (1.1%) and pancreatic cancer with 117 cases (1.1%).

Conclusion:
Treatment chronology shows how IORT number of recorded cases increased according with the interest in this ISIORT project. This survey gives an overview of worldwide use of IORT including patient selection criteria and treatment modalities and could represent a basis to design future clinical trials.

Multidisciplinary Management of Spine Metastasis (V_IORT)

Roberto Orecchia

Spine Metastasis

- **Metastatic tumors are the most common (97%) tumors of the spine, because the spine is well vascularized and has close relationship with regional lymphatic and venous drainage systems (especially Batson's venous plexus)**
- **The percentage of cancer patients who have had bone metastasis before death is between 50% and 70%, and in case of breast cancer this percentage rose up to 85%**
- **Other most frequent tumors metastatising in the spine are adenocarcinomas from the lung, prostate, kidney, gastrointestinal tract and thyroid**
- **The most common (70%) sites for spine metastasis are thoracic and thoracolumbar spine, and lumbar spine and sacrum have more than 20% of metastatic lesions. Cervical spine is a less frequent metastasis site**

Skeletal conseguences

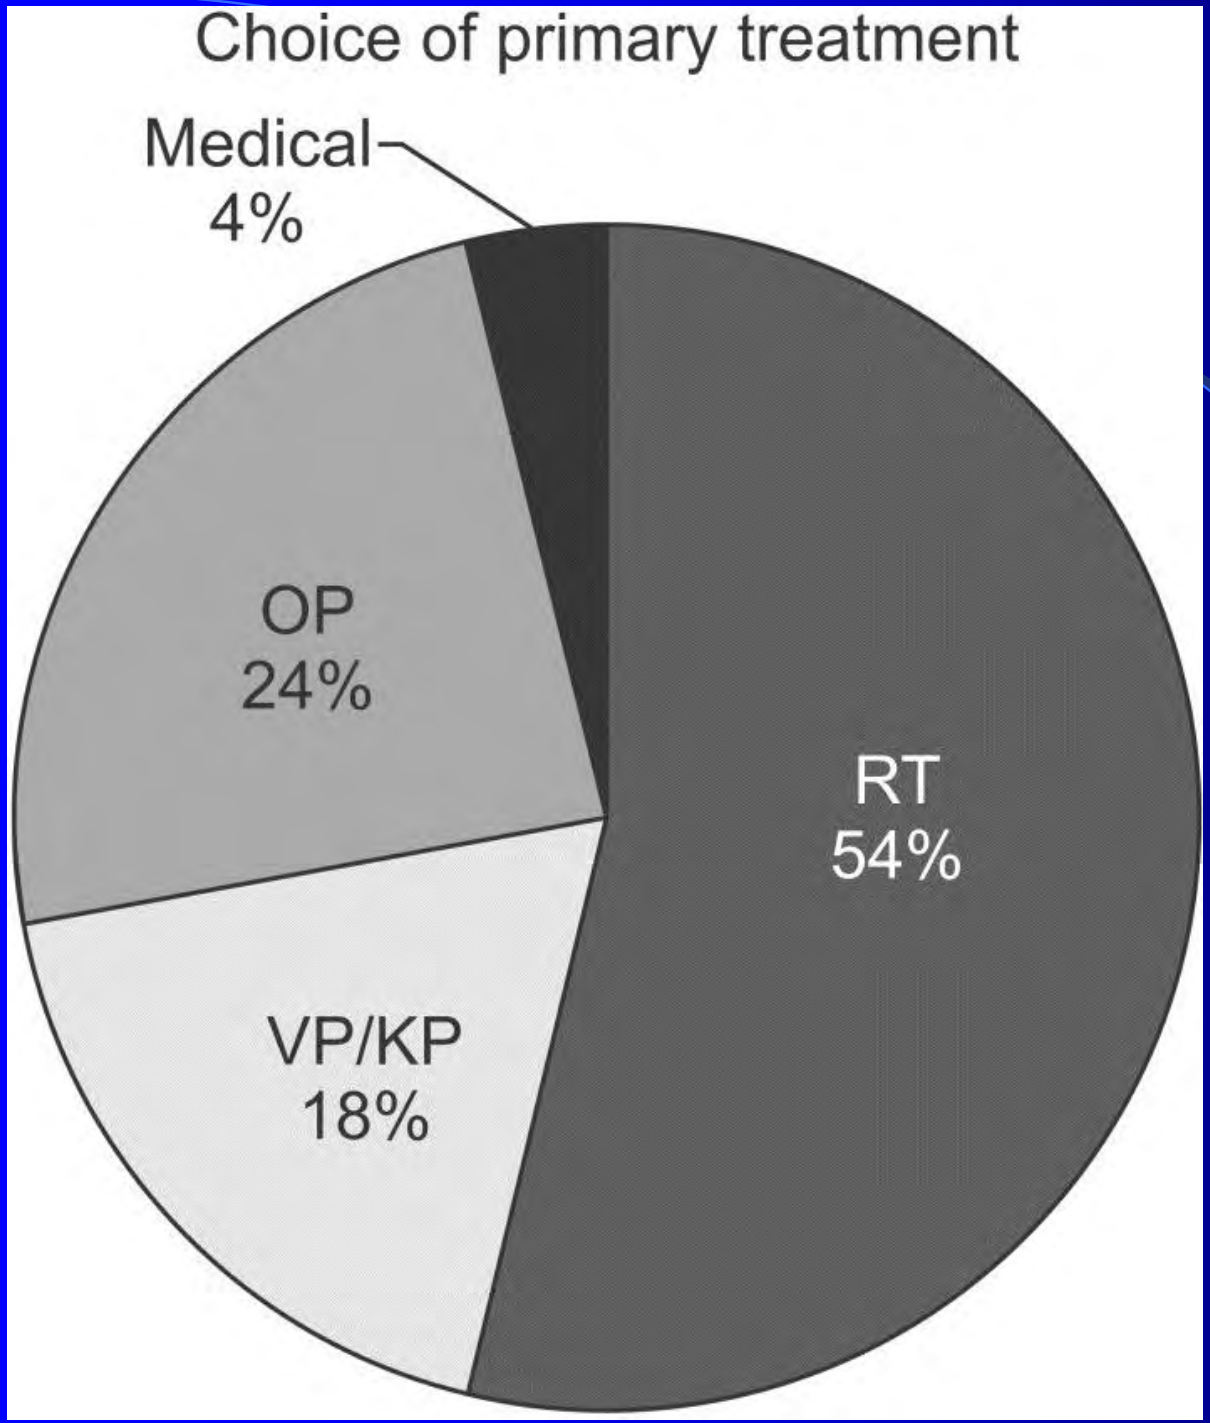
Consequences to functional independence and QoL

Spine metastasis

- Fracture
- SCC or vertebral collapse
- Hypercalcemia
- Surgery to bone

- Loss of autonomy
- Pain
- Anxiety and depression

SCC = Spinal cord compression
QoL = Quality of life



- RT is the most common primary choice
- OP can be considered for the relief of neurologic symptoms
- VP or KP can be considered for the short-term control of localized pain
- **Multidisciplinary guidelines are required**

Cho JH et al,
Clin Orthop Surg 2015

Spine Metastasis

- RT is effective in reducing pain on most of the patients (more than 80%)
- RT avoid spinal cord compression if the patient at risk is treated soon
- RT improves motor function in 45% to 60% of the cases with impaired functions

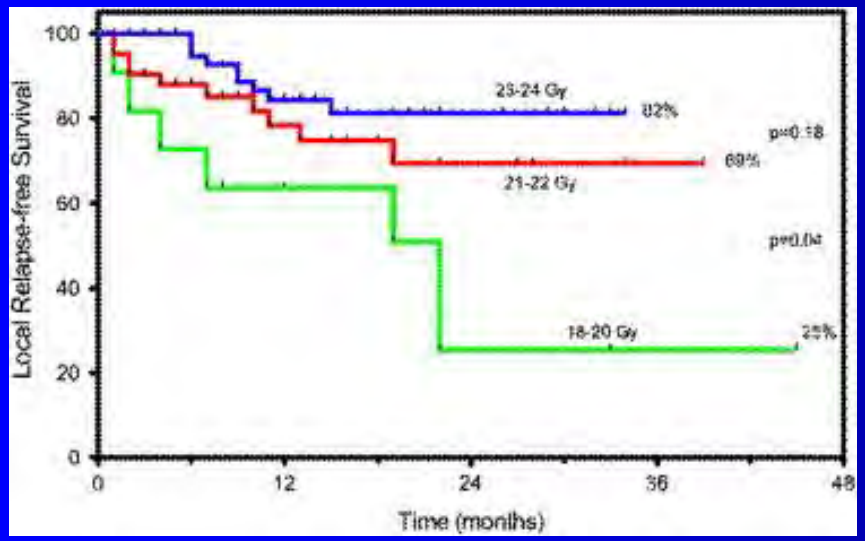
SBRT Spine Plan Comparison

IEO Arc

Vertebral Compression Fracture

VCF after conventional radiotherapy: < 5%

VCF after SBRT: from 11% to 39%



Greco C et al, IJROB 2012, 79: 1151-7

Zelefsky M et al, IJROBP 2012, 82: 1744-8

Spine Metastasis

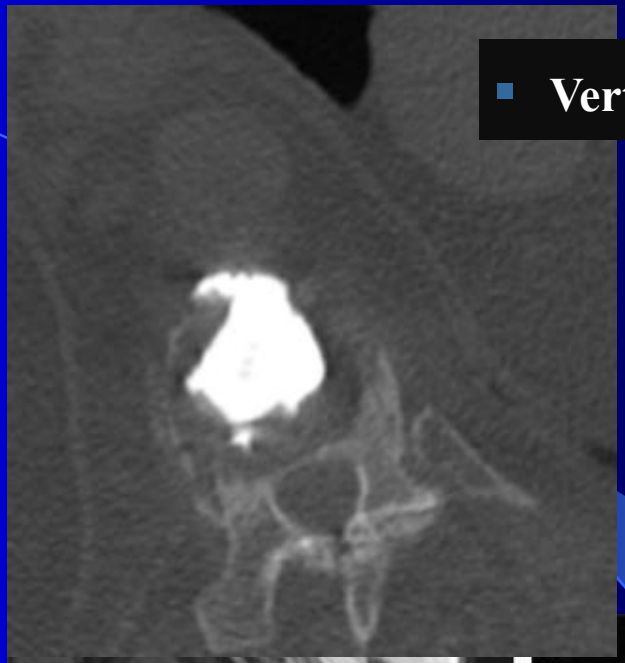
- Percoutaneous VertebroPlasty (PVP) and Percoutaneous KyphoPlasty (PKP) increase bone strenght and alleviate pain by mechanical stabilization

- A systemic meta-analysis comparing PVP and PKP demostrates that both are safe and effective procedures

  (Hua wang et al, Pain Physician 2015)

- Vertebroplasty or Kyphoplasty are not antitumoral treatments by themselves
- A combination of these techniques with an antitumoral treatment should be considered
- RT is effective in preventing local relapse and could be the best option for the combined approach

Brahimi Y et al,
Cancer/Radiothérapie 2016



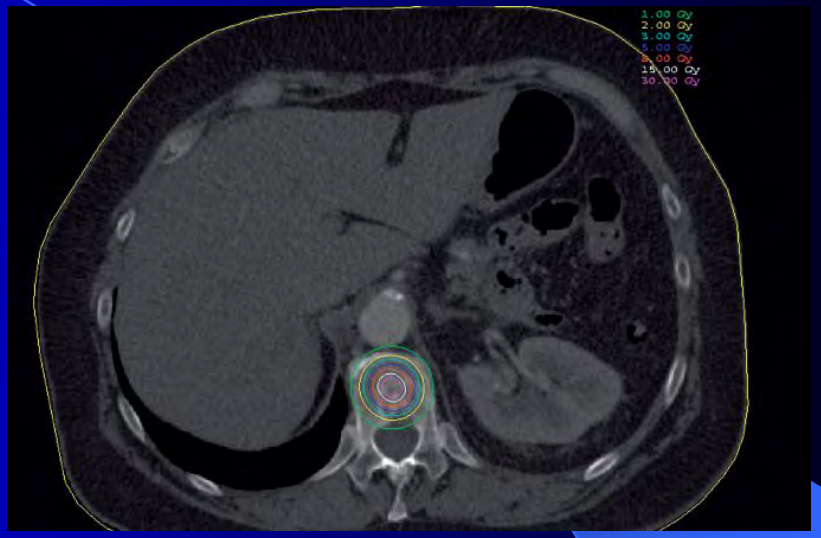
- Vertebroplasty of T 11

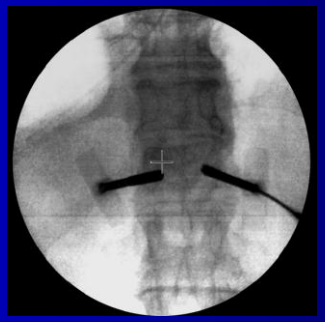
- Local recurrence around the cement of T 11

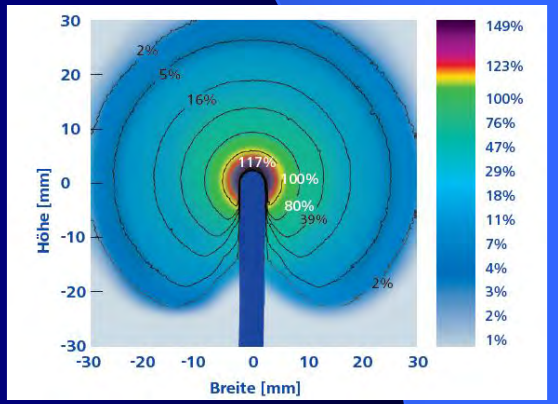
Combined treatment

- With EBRT (two steps)
- With I-125 implantation (one step)
- With IORT (one step)

Kypho-IORT







Wenz F et al. Radiation Oncology 2010

Kypho-IORT

Part I: Irradiation

Vertebral body containing a bone metastasis

Step 1: A minimal invasive access is created

Step 2: Radiation (<5 min) of the bone metastasis at its precise location

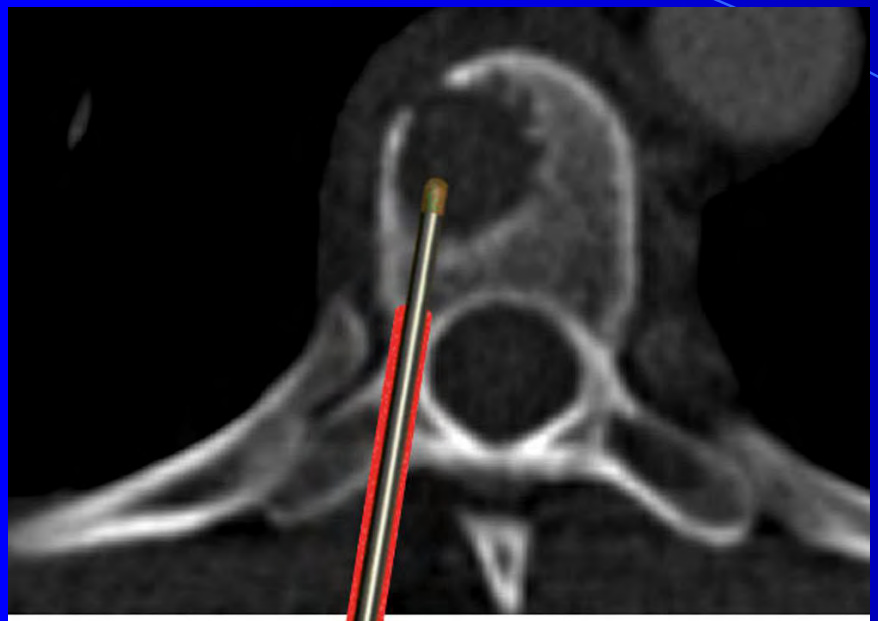
Part II: Stabilization

Step 3: A balloon is inserted in the vertebral body containing the lesion

Step 4: The balloon is carefully inflated, returning the vertebral body to its normal position

Step 5: The cavity created by the balloon is filled with bone cement for stabilization

Kypho-IORT



- Age ≥50 year
- Spinal mets (≤2 cm)
- Caudal to T 3
- PFS at 3, 6 and 12 months of 97.5%, 93.8% and 91.2%
- Significant pain reduction median VAS 5/10 before to 2/10 after, mantained on the time
- Dose-escalation study, from 8 Gy in 8 mm (isocenter), to 8 Gy in 10 mm, and to 8 Gy in 13 mm (MTD)

Take Home Message (I)

- The bone is the third most frequent site for metastasis, with the focus in the spine
- RT is often the main choice of therapy, also combined with surgery for patients who require metastasis resection and stabilization
- Less invasive techniques, such as VP and KP, have shown their effectiveness in reducing pain, and stabilize the column

Take Home Message (II)

- The combination of VP/KP with high single dose of RT (IORT) has potential benefits in term of pain and tumor control, and prophylactic stabilization
- The combined procedure is feasible, without any additional risks, and fast
- Further studies are strongly recommended for definitive evaluation of this very promising approach
